In the title compound,  $C_{15}H_{15}N_3S_2$ , the central pyrazole ring adopts a twisted conformation on the  $-\text{CH}-\text{CH}_2-$  bond. Its mean plane makes dihedral angles of 7.19 (12) and 71.13 (11) $^\circ$  with those of the thiophene and toluene rings, respectively. The carbothiamide group [ $\text{C}(=\text{S})-\text{N}$ ] is inclined to the pyrazole ring mean plane by 16.8 (2) $^\circ$ . In the crystal, molecules are linked by  $\text{N}-\text{H}\cdots\text{S}$  hydrogen bonds, forming chains propagating along [010]. Within the chains, there are  $\text{N}-\text{H}\cdots\pi$  interactions present. Between the chains there are weak parallel slipped  $\pi-\pi$  interactions involving inversion-related thiophene and pyrazole rings [inter-centroid distance = 3.7516 (14) Å; inter-planar distance = 3.5987 (10) Å; slippage = 1.06 Å].

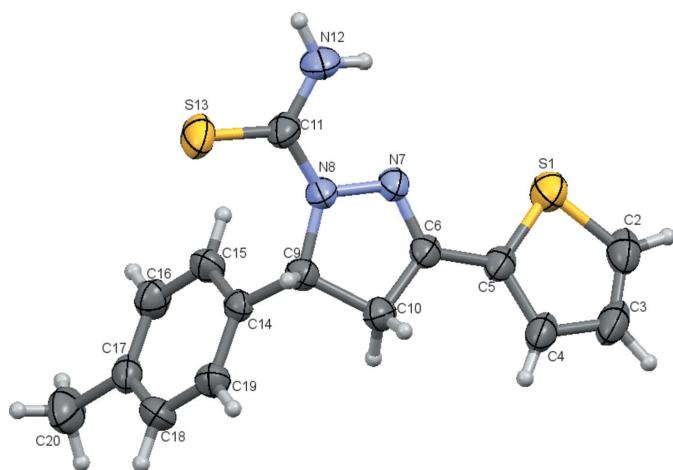

## 1. Chemical context

Five-membered heterocyclic pyrazole analogues have been used extensively as building blocks in organic synthesis. They have been transformed efficiently into molecules of potential medicinal and pharmaceutical important. Pyrazole derivatives have known to exhibit diverse biological applications such as antidiabetic, anaesthetic, antimicrobial and antioxidant. In addition, they have also shown potential anticancer and antiamoebic activity and to be potent and selective inhibitors of tissue-nonspecific alkaline phosphatase (Sidique *et al.* 2009). Earlier we synthesized  $\alpha$  and  $\beta$ -unsaturated compounds which served as useful intermediates for the synthesis of pyrazolines (Manjula *et al.*, 2013) and thiazepines (Manjunath *et al.*, 2014). As part of our ongoing research on pyrazole analogues, the title compound was synthesized and we report herein on its crystal structure. Studies of the biological activity of the title compound are underway and will be reported elsewhere.

## 2. Structural commentary

The molecular structure of the title compound is illustrated in Fig. 1. The central pyrazole ring (N7/N8/C8–C10) adopts a

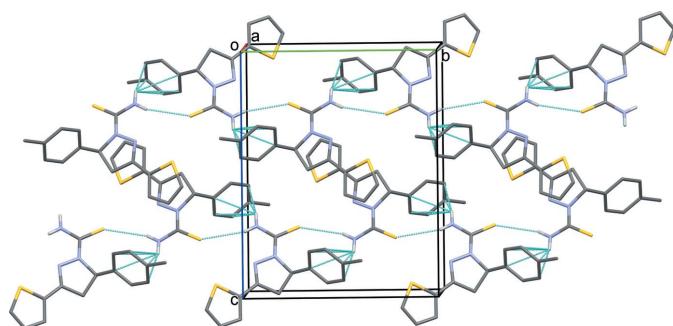

**Figure 1**

View of the molecular structure of the title compound, showing the atom labelling. Displacement ellipsoids are drawn at the 50% probability level.

twisted conformation with respect to the C9–C10 bond and its mean plane makes dihedral angles of 7.19 (12) and 71.13 (11) $^{\circ}$  with the thiophene (S1/C2–C5) and toluene (C14–C19) rings, respectively. The carbothiamide group [C11(=S13)N12] lies in the plane of the pyrazole ring, as indicated by the torsion angles N12–C11–N8–N7 = 0.6 (3) and S13–C11–N8–N7 = 179.96 (16) $^{\circ}$ , and adopts +syn-periplanar and +anti-periplanar conformations, respectively. The title compound possess a chiral center at atom C9 but crystallized as a racemate.

### 3. Supramolecular features

In the crystal, molecules are linked by N–H $\cdots$ S hydrogen bonds, forming chains propagating along [010]. Within the chains there are N–H $\cdots$  $\pi$  interactions involving the toluene ring (Fig. 2 and Table 1). Between the chains there are weak parallel slipped  $\pi$ – $\pi$  interactions involving inversion-related thiophene and pyrazole rings [ $Cg1\cdots Cg2^i$  = 3.7516 (14) Å; inter-planar distance = 3.5987 (10) Å; slippage = 1.06 Å;  $Cg1$

**Figure 2**

A view along the  $a$  axis of the crystal packing of the title compound. The hydrogen bonds and C–H $\cdots$  $\pi$  interactions are shown as dashed lines (see Table 1 for details). C-bound H atoms have been omitted for clarity.

**Table 1**  
Hydrogen-bond geometry ( $\text{\AA}$ ,  $^{\circ}$ ).

$Cg3$  is the centroid of the benzene ring C14–C19.

$D-\text{H}\cdots A$	$D-\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D-\text{H}\cdots A$
N12–H12A $\cdots$ S13 <sup>i</sup>	0.86	2.83	3.620 (2)	154
N12–H12B $\cdots$ Cg3 <sup>i</sup>	0.86	2.81	3.443 (2)	132

Symmetry code: (i)  $-x + 1, y - \frac{1}{2}, -z + \frac{3}{2}$ .

and  $Cg2$  are the centroids of rings S1/C2–C5 and N7/N8/C8–C10, respectively; symmetry code: (i)  $-x + 2, -y + 1, -z + 1$ .

### 4. Database survey

A search of the Cambridge Structural Database (Version 5.36, May 2015; Groom & Allen, 2014) revealed seven structures containing the 3-(thiophen-2-yl)-pyrazole unit. Amongst these are two thioamides; the phenyl derivative of the title compound, 5-phenyl-3-(2-thienyl)-2-pyrazoline-1-thioamide (HEFXEW; Işık *et al.*, 2006), and 1-(*N*-ethylthiocarbamoyl)-3,5-bis(2-thienyl)-2-pyrazoline (YINFUX; Köysal *et al.*, 2007). In these two compounds, the pyrazole rings have envelope conformations with the methine C atom as the flap, and the mean planes of the two rings are inclined to one another by 11.98 and 10.13 $^{\circ}$ , respectively. This is in contrast to the situation in the title compound where the pyrazole ring has a twisted conformation on the –CH–CH<sub>2</sub>– bond and its mean plane is inclined to the thiophene ring by 7.19 (12) $^{\circ}$ . In the crystal of the phenyl derivative (HEFXEW), molecules are also linked by N–H $\cdots$ S hydrogen bonds, forming chains.

### 5. Synthesis and crystallization

A mixture of 3-(4-methylphenyl)-1-(thiophen-2-yl)prop-2-en-1-one (0.001 mol) and thiosemicarbazine hydrochloride (0.01 mol) and potassium hydroxide (0.02 mol) in ethyl alcohol (20 ml) was refluxed on a water bath for 6–8 h. The progress of the reaction was monitored by TLC. After completion of the reaction, the mixture was poured into ice-cold water and stirred. The solid that separated was filtered, and washed with ice-cold water. The product was recrystallized from ethyl alcohol to give the title compound as rectangular yellow crystals. Analysis calculated for C<sub>15</sub>H<sub>15</sub>N<sub>3</sub>S<sub>2</sub>: C, 59.77; H, 5.02; N, 13.94%; found: C, 59.74; H, 5.06; N, 13.88%. <sup>1</sup>H NMR (CDCl<sub>3</sub>):  $\delta$  2.297 (s, 3H, CH<sub>3</sub>), (dd, 1H, C4–Hb:  $J$  = 18.0, 8.5 Hz), (dd, 1H, C4–Hb:  $J$  = 18.0, 8.5 Hz), 5.976–6.013 (dd, 1H, C–Ha:  $J$  = 18.0, 12.0 Hz), 6.163–7.169 (m, 7H, Ar–H and thiophene ring–H), 7.330 (s, 2H, –NH<sub>2</sub>). <sup>13</sup>C NMR (CDCl<sub>3</sub>):  $\delta$  43.77 (1C, C-4), 63.34 (1C, C-5), 125.35 (2C, Ar–C), 127.88 (1C, 5 m ring–C), 129.57 (1C, Ar–C), 129.67 (1C, Ar–C), 129.72 (1C, 5 m ring–C), 130.01 (1C, 5 m ring–C), 134.12, (1C, 5 m ring–C), 137.31 (1C, Ar–C), 138.67 (1C, Ar–C), 151.38 (1C, C-3), 176.36 (1C, C=S). MS (*m/z*): 303 (M+2, 10) 302 (M+1, 18), 301 (M+, 100), 284 (40), 161 (15).

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. H atoms were fixed geometrically

and allowed to ride on their parent atoms: C—H = 0.93–0.98 Å with U<sub>iso</sub>(H) = 1.5U<sub>eq</sub>(C) for methyl H atoms and 1.2U<sub>eq</sub>(C) for other H atoms.

## Acknowledgements

The authors are thankful to the IOE, Vijnana Bhavana, University of Mysore, Mysore, for providing the single-crystal X-ray diffraction facility. IW is grateful to An-Najah National University and Zamala (fellowship program for the development of university education) for financial support.

### Special details

**Geometry.** Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement on  $F^2$  for ALL reflections except those flagged by the user for potential systematic errors. Weighted  $R$ -factors  $wR$  and all goodnesses of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The observed criterion of  $F^2 > \sigma(F^2)$  is used only for calculating  $-R$ -factor-obs *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

*Hydrogen-bond geometry (Å, °)*

Cg3 is the centroid of the benzene ring C14—C19.

D—H···A	D—H	H···A	D···A	D—H···A
N12—H12 <i>A</i> ···S13 <sup>i</sup>	0.86	2.83	3.620 (2)	154
