Received 6 December 2008; accepted 10 December 2008

Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  
 $R$  factor = 0.034;  $wR$  factor = 0.090; data-to-parameter ratio = 37.2.

The asymmetric unit of the title compound,  $\text{C}_{13}\text{H}_{11}\text{IN}_2\text{O}$ , comprises two crystallographically independent molecules. The dihedral angles between the ring planes are 53.56 (9) and 72.14 (19)° in the two molecules. Pairs of intermolecular N—H···N hydrogen bonds and I···O interactions link neighbouring molecules into two different pairs of dimers, those involving N—H···N interactions having  $R_2^2(8)$  ring motifs. Short intermolecular I···O [3.1458 (15) Å] and I···N [3.4834 (16) Å] contacts are present. The crystal structure is further stabilized by intermolecular C—H···π interactions [3.565 (2) and 3.629 (2) Å].

## **2-Iodo-N-(6-methyl-2-pyridyl)benzamide**

**H.-K. Fun, R. Kia, A. C. Maity, S. Maity and S. Goswami**

### **Comment**

The role of hydrogen bonds involving neutral amidic-type NH and carbonyl type O-atom in the controlled assembly of biologically relevant molecules giving outstanding architectures is an obvious entity in nature. Amide derivatives of heterocyclic compounds are important hydrogen bonding synthons as they are the very useful substrates which can be used for the synthesis of designed receptors in the field of molecular recognition (Goswami & Dey 2006 *a*; Goswami *et al.*, 2005*a*) and supramolecular chemistry (Steed & Atwood 2001; Lehn 1995; Desiraju 2003). We have previously reported the design and synthesis of a series of symmetric diamido biaryls by direct homocoupling of iodoarylbenzamides (Goswmai *et al.* 2005*b*).

In the title compound (I), Fig. 1, intramolecular C—H···O hydrogen bonds generate six-membered rings, producing *S*(6) ring motifs. Pairs of intermolecular N—H···N hydrogen bonds and I···O interactions link neighbouring molecules into two different pairs of dimers, those involving N—H···N interactions having  $R^2_2(8)$  ring motifs (Fig. 2). The interesting features of the crystal structure are the short intermolecular I···O [3.1458 (15) Å; symmetry: 1 -  $x$ , 1 -  $y$ , - $z$ ] and I···N [3.4834 (16) Å; symmetry:  $x$ ,  $y$ ,  $z$ ] contacts which are significantly shorter than the sum of the van der Waals radii of these atoms. The crystal structure is further stabilized by intermolecular C—H···π interactions (Table 1,  $Cg1$  and  $Cg2$  are the centroids of the C1A–C6A and C1B–C6B benzene rings).

### **Experimental**

To a magnetically stirred solution of the 2-amino-6-methylpyridine (108 mg, 1.0 mmol) in dry  $\text{CH}_2\text{Cl}_2$  (20 ml) and freshly distilled triethylamine (1.2 equiv), was added 2-iodobenzoyl chloride (1.1 equiv). Stirring was continued for 12 h. The triethylamine hydrochloride was filtered off, the organic layer after washing with water was dried (anhydrous  $\text{Na}_2\text{SO}_4$ ) and then the solvent was removed under reduced pressure. The residue was purified using column chromatography on silica-gel to afford (I) (310 mg, 92%).

### **Refinement**

N-bound hydrogen atoms were located from a difference Fourier map and refined freely; see Table 1 for N—H distances. The remaining H atoms were positioned geometrically with C—H = 0.93 Å (aromatic) or 0.96 Å (methyl), and refined in the riding model approximation with  $U_{\text{iso}}(\text{H}) = 1.2$  or 1.5  $U_{\text{eq}}(\text{C})$ . A rotating group model was used for the methyl groups. The highest peak (2.34 e.  $\text{\AA}^{-3}$ ) is located 0.70 Å from I1A and the deepest hole (-1.51 e.  $\text{\AA}^{-3}$ ) is located 0.75 Å from I1A.

### Crystal data

$C_{13}H_{11}IN_2O$	$Z = 4$
$M_r = 338.14$	$F_{000} = 656$
Triclinic, $P\bar{1}$	$D_x = 1.784 \text{ Mg m}^{-3}$
Hall symbol: -P 1	Mo $K\alpha$ radiation
$a = 9.8687 (3) \text{ \AA}$	$\lambda = 0.71073 \text{ \AA}$
$b = 10.1276 (3) \text{ \AA}$	Cell parameters from 9385 reflections
$c = 13.6366 (4) \text{ \AA}$	$\theta = 2.5\text{--}35.9^\circ$
$\alpha = 97.521 (1)^\circ$	$\mu = 2.53 \text{ mm}^{-1}$
$\beta = 93.113 (1)^\circ$	$T = 100.0 (1) \text{ K}$
$\gamma = 110.380 (1)^\circ$	Plate, colourless
$V = 1259.28 (6) \text{ \AA}^3$	$0.49 \times 0.32 \times 0.12 \text{ mm}$

### Data collection

Bruker SMART APEXII CCD area-detector diffractometer	11804 independent reflections
Radiation source: fine-focus sealed tube	9568 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.036$
$T = 100.0 (1) \text{ K}$	$\theta_{\max} = 36.0^\circ$
$\varphi$ and $\omega$ scans	$\theta_{\min} = 2.2^\circ$
Absorption correction: multi-scan ( <i>SADABS</i> ; Bruker, 2005)	$h = -16\text{--}16$
$T_{\min} = 0.374$ , $T_{\max} = 0.746$	$k = -16\text{--}16$
47136 measured reflections	$l = -22\text{--}21$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites

$R[F^2 > 2\sigma(F^2)] = 0.034$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.090$	$w = 1/[\sigma^2(F_o^2) + (0.0498P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.05$	$(\Delta/\sigma)_{\max} = 0.002$
11804 reflections	$\Delta\rho_{\max} = 2.34 \text{ e \AA}^{-3}$
317 parameters	$\Delta\rho_{\min} = -1.51 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

### Special details

**Experimental.** The low-temperature data was collected with the Oxford Cyrosystem Cobra low-temperature attachment.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
