Received 5 September 2010; accepted 6 September 2010

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.039;  $wR$  factor = 0.111; data-to-parameter ratio = 13.3.

In the title compound,  $\text{C}_{18}\text{H}_{13}\text{NO}_2$ , the naphthalene (r.m.s. deviation = 0.025 Å) and benzaldehyde (r.m.s. deviation = 0.006 Å) groups are oriented at a dihedral angle of 89.48 (4)°. The oxazine group is oriented at dihedral angles of 13.36 (4) and 85.08 (5)°, respectively, with respect to the naphthalene and benzaldehyde fragments. In the crystal, inversion dimers linked by pairs of C–H···O hydrogen bonds generate  $R_2^2(8)$  loops. The dimers are linked into [010] chains via N–H···O hydrogen bonds. Weak C–H···π links and aromatic π–π stacking between the centroids of the naphthalene phenyl rings [centroid–centroid separation = 3.5977 (8) Å] help to consolidate the packing.

#### Comment

Oxazinones are an important class of heterocyclic compounds with a diverse range of biological activities (Patel *et al.*, 1999; Waxman & Darke, 2000). During recent studies for the search of efficient, simple and green method for the preparation of naphthalene-condensed 1,3-oxazin-3-one derivatives, we have obtained the title compound (I, Fig. 1).

In the title compound, the naphthalene group A (C1—C10) and moiety B (C11—C17) of benzaldehyde group are planar with r. m. s. deviations of 0.0252 and 0.0056 Å, respectively. The dihedral angle between A/B is 89.48 (4)°. The fused group C (O1/C18/O2/N1) is also planar with r. m. s. deviation of 0.0037 Å. The dihedral angle between A/C and B/C is 13.36 (4) and 85.08 (5)°, respectively. The title compound is dimerized due to H-bonding of C—H···O type (Table 1, Fig. 2) with  $R_2^{2}(8)$  ring motifs (Bernstein *et al.*, 1995). The dimers are interlinked due to N—H···O type of H-bondings (Table 1, Fig. 2). There exists  $\pi$ — $\pi$  interaction between the centroids of phenyl rings (C1/C6—C10) at a distance of 3.5977 (8) Å [symmetry code: 2 -  $x$ , -  $y$ , 1 -  $z$ ]. The molecules are stabilized in the form of infinite one dimensional polymeric chains extending along the *c* axis.

#### Experimental

A mixture of  $\beta$ -naphthol (1.0 mmol), benzaldehyde (1.0 mmol), urea (1.0 mmol) and CuCl<sub>2</sub> (0.1 mm mol) as a catalyst, were heated at 393 K in a round bottom flask for 3 h. The reaction was monitored through TLC. After completion of the reaction, the mixture was cooled to room temperature and washed thoroughly with distilled water. The crude product obtained was recrystallized from petroleum ether:ethyl acetate (1:5) to afford colourless rods of (I) after 24 h.

#### Refinement

The H-atoms were positioned geometrically (C—H = 0.93–0.96 Å) and were included in the refinement in the riding model approximation, with  $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C})$ , where  $x = 1.5$  for methyl and  $x = 1.2$  for aryl H-atoms.

#### Figures

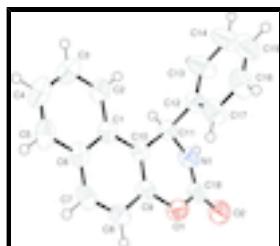

Fig. 1. View of (I) with displacement ellipsoids drawn at the 50% probability level. H-atoms are shown as small spheres of arbitrary radii.

## supplementary materials

---

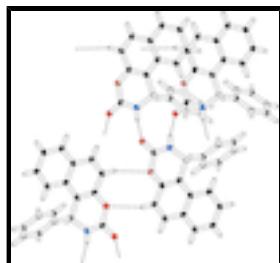

Fig. 2. The partial packing of (I), which shows that molecules are dimerized which are inter-linked in one dimensional infinite polymeric chains.

#### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.039$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.111$	H-atom parameters constrained
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0535P)^2 + 0.2624P]$
2533 reflections	where $P = (F_o^2 + 2F_c^2)/3$
	$(\Delta/\sigma)_{\text{max}} < 0.001$

190 parameters  $\Delta\rho_{\max} = 0.16 \text{ e } \text{\AA}^{-3}$   
 0 restraints  $\Delta\rho_{\min} = -0.15 \text{ e } \text{\AA}^{-3}$

### Special details

**Geometry.** Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

### Hydrogen-bond geometry ( $\text{\AA}$ , $^\circ$ )

Cg2 is the centroid of the C1—C6 phenyl ring.

$D\text{—H}\cdots A$	$D\text{—H}$	$H\cdots A$	$D\cdots A$	$D\text{—H}\cdots A$
N1—H1 $\cdots$ O2 <sup>i</sup>	0.86	2.07	2.8698 (17)	155
C8—H8 $\cdots$ O1 <sup>ii</sup>	0.93	2.58	3.4725 (18)	161
C16—H16 $\cdots$ Cg2 <sup>iii</sup>	0.93	2.92	3.722 (2)	145

Symmetry codes: (i)  $x, -y+1/2, z-1/2$ ; (ii)  $-x+2, -y, -z+2$ ; (iii)  $-x+1, -y, -z+1$ .
