

Since January 2020 Elsevier has created a COVID-19 resource centre with free information in English and Mandarin on the novel coronavirus COVID-19. The COVID-19 resource centre is hosted on Elsevier Connect, the company's public news and information website.

Elsevier hereby grants permission to make all its COVID-19-related research that is available on the COVID-19 resource centre - including this research content - immediately available in PubMed Central and other publicly funded repositories, such as the WHO COVID database with rights for unrestricted research re-use and analyses in any form or by any means with acknowledgement of the original source. These permissions are granted for free by Elsevier for as long as the COVID-19 resource centre remains active.

**Clinical trial identification:** NCT03818230, NHS001389.

**Legal entity responsible for the study:** The University of Manchester.

**Funding:** Has not received any funding.

**Background:** Cancer patients are at high risk of psychological problems and COVID-19 infection, which makes them even more vulnerable to mood disorders. Our objectives were to analyze the level of anxiety and depression among patients with advanced cancer during the COVID-19 pandemic and to analyze the association between sociodemographic, clinical, and psychological factors in patients with advanced cancer.

**Methods:** A prospective, cross-sectional, multicenter study was conducted in 15 oncology departments in Spain. Patients with locally advanced unresectable or metastatic cancer who were candidates for systemic treatment were included. Patients completed demographic information and the Brief Symptom Inventory (BSI), Michels Uncertainty in Illness Scale (MUIS), Mental Adjustment to Cancer (MAC), and Cancer Worry Scale (CWS).

**Results:** A total of 374 patients were recruited (April 2020-2021). The mean age was 64.2 years (34-88) and 48.7% were women. The most frequent were lung (30.7%) and colon (14.2%) cancers and most had metastases (78.6%). The most frequent therapy was chemotherapy (57.9%). The prevalence of anxiety and depression was 35% and 34%, respectively. Anxiety and depression levels were higher in women ( $p=0.001$  and  $p=0.003$ , respectively). Patients <65 years ( $p=0.017$ ) and with an oncologist-estimated survival of >18 months ( $p=0.033$ ) had more anxiety symptoms. Logistic regression analysis revealed that women, patients with coping based on anxious preoccupation and hopelessness had higher risk of anxiety and depression (all,  $p<0.001$ ).

**Conclusions:** Patients with advanced cancer who start treatment during the COVID-19 pandemic experience high levels of depression and anxiety. Early diagnosis and the development of intervention strategies are needed especially in specific patient subgroups such as young women with long survival estimated times.

#### 1495P Anxiety and depression in cancer patients receiving oncology treatment: Associated factors

E. Arvanitou<sup>1</sup>, E. Parpa<sup>2</sup>, E. Tsilika<sup>2</sup>, C. Christofyllakis<sup>1</sup>, N.G. Tsoukalas<sup>1</sup>, K. Mystakidou<sup>2</sup>

<sup>1</sup>Oncology Department, 401 General Military Hospital of Athens, Athens, Greece; <sup>2</sup>Palliative Care Unit, Department of Radiology, University Areteion Hospital School of Medicine, Athens, Greece

**Background:** Cancer diagnosis is related to fear and is a source of great distress for patients. Anxiety and depression are common in cancer patients and seem to affect quality of life, treatment compliance and even survival. Demoralization, that encompass feelings of despair, loss of meaning and spiritual distress, can occur in patients with cancer. The aim of this study is to investigate the relationship between demoralization, anxiety, and depression and to examine demographic and clinical factors associated with anxiety and depression.

**Methods:** A convenience sample of 150 cancer inpatients and outpatients from two oncology centers, with various types of solid tumors, receiving oncology treatment, participated in a prospective cross-sectional observational study. The psychometric tools used were the Greek version of the Hospital Anxiety and Depression Scale (HAD) and the Demoralization Scale (DEMORALIZATION SCALE II, DS-II). The study was approved by the ethical committee or related boards of each hospital. Each patient was informed about the aims of the study and gave his/her written consent to participate.

**Results:** Patients mean age was 62 years (20-85 years) and 89 patients (59.3%) were women. Among patients, 33% had breast, 24% gastrointestinal and 15% lung cancer. A number of 82 patients (54.7%) had metastatic disease. Women showed higher rates of anxiety ( $p = 0.054$ ). Anxiety was inversely related to age ( $p = 0.043$ ) and positively correlated with time since diagnosis ( $p = 0.076$ ). Unmarried patients presented higher rates of depression ( $p = 0.026$ ). Multiple linear regression showed a statistically significant impact of Demoralization on anxiety ( $p < 0.001$ ,  $R^2 = 36.3\%$ ) and depression ( $p < 0.001$ ,  $R^2 = 49\%$ ).

**Conclusions:** The results highlight the significant impact of demoralization on anxiety and depression in cancer patients. This emphasizes the need for empathy and apprehension of patients' feelings by health care providers, to timely recognize feelings of despair and distress.
