# Crystal structure of (E)-N-\{2-[2-(2-chlorobenzyl-idene)hydrazin-1-yl]-2-oxoethyl\}-4-methylbenzamide monohydrate 

H. Purandara, ${ }^{\text {a }}$ Sabine Foro ${ }^{\text {b }}$ and B. Thimme Gowda ${ }^{\mathrm{a}, \mathrm{c}_{*}}$

${ }^{\text {a }}$ Department of Chemistry, Mangalore University, Mangalagangotri 574 199, Mangalore, India, ${ }^{\mathbf{b}}$ Institute of Materials Science, Darmstadt University of Technology, Alarich Weiss Strasse 2, D-64287 Darmstadt, Germany, and ${ }^{\text {c }}$ Bangalore University, Jnanabharati, Bangalore 560 056, India. *Correspondence e-mail: gowdabt@yahoo.com

The title compound, $\mathrm{C}_{17} \mathrm{H}_{16} \mathrm{ClN}_{3} \mathrm{O}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$, an acylhydrazone derivative, contains a glycine moiety and two substituted benzene rings on either end of the chain. It crystallized as a monohydrate. The molecules adopt an $E$ conformation with respect to the $\mathrm{C}=\mathrm{N}$ double bond, as indicated by the $\mathrm{N}-\mathrm{N}=\mathrm{C}-\mathrm{C}$ torsion angle of $179.38(14)^{\circ}$. The molecule is twisted in such a way that the almost planar $\mathrm{C}_{\mathrm{ar}}-\mathrm{C}(=\mathrm{O})-\mathrm{N}(\mathrm{H})-\mathrm{C}\left(\mathrm{H}_{2}\right)$ and $\mathrm{C}\left(\mathrm{H}_{2}\right)-\mathrm{C}(=\mathrm{O}) \mathrm{N}(\mathrm{H})-\mathrm{N}=\mathrm{C}-\mathrm{C}_{\mathrm{ar}}$ [r.m.s deviations $=0.009$ and $0.025 \AA$, respectively] segments are inclined to on another by $77.36(8)^{\circ}$, while the benzene rings are normal to one another, making a dihedral angle of $89.69(9)^{\circ}$. In the crystal, the water molecule links three molecules through two $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ and one $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds. The molecules are linked via pairs of $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, forming inversion dimers with an $R_{2}^{2}(14)$ ring motif. The dimers are linked by $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds, involving two molecules of water, forming chains along [100], enclosing $R_{2}^{2}(14)$ and $R_{2}^{2}(18)$ ring motifs. The chains are linked through $\mathrm{C}-$ $\mathrm{H} \cdots \mathrm{O}$ interactions, forming sheets parallel to (010). Within the sheets, there are $\mathrm{C}-\mathrm{H} \cdots \pi$ and parallel slipped $\pi-\pi$ stacking interactions present [inter-centroid distance $=3.6458$ (12) Å].

## 1. Chemical context

$N$-Acylhydrazones have been reported to be promising in terms of their future potential as antibacterial drugs (Osorio et al., 2012). These predictions have provided a therapeutic pathway to develop new effective biologically active Schiffbase derivatives. $N$-Acylhydrazones may exist as $Z / E$ geometrical isomers about the $\mathrm{C}=\mathrm{N}$ double bond and as syn/anti amide conformers (Palla et al., 1986). The carbonyl group in the acylhydrazone provides the possibility for electron delocalization within the hydrazone moiety. The anti-TNF- $\alpha$ activity of glycinyl-hydrazone derivatives indicate that differences in the hydrophobicity of the imine-attached framework plays an important role. The study of conformational isomers of the amide unit of an $N$-methyl $N$-acylhydrazone derivative suggested that the amino spacer does not participate as a hydrogen-bond donor in the stabilization of the conformational isomers in solution (Lacerda et al., 2012).

Prompted by the biological and structural importance of Schiff bases, as part of our structural studies (Gowda et al.,

Figure 1
The molecular structure of the title compound, showing the atom labelling. Displacement ellipsoids are drawn at the $50 \%$ probability level.

2000; Rodrigues et al., 2011; Jyothi \& Gowda, 2004; Usha \& Gowda, 2006; Purandara et al., 2015), we report herein on the synthesis, characterization and crystal structure of the title compound, (I), a new $N$-acylhydrazone derivative.

## 2. Structural commentary

The title compound crystallizes as a monohydrate (Fig. 1). The conformation of the $\mathrm{N}-\mathrm{H}$ bond in the amide part is anti with respect to both the $\mathrm{C}=\mathrm{O}$ bonds in the molecule, while the $\mathrm{N}-$ H bond in the hydrazone part is syn to both the $\mathrm{C}=\mathrm{O}$ (hydrazone) and the $\mathrm{C}-\mathrm{H}$ (imine) bonds. The $\mathrm{C} 9-\mathrm{O} 2$ bond length of 1.2251 (19) $\AA$ indicates that the molecule exists in the keto form in the solid state, and the $\mathrm{C} 10-\mathrm{N} 3$ bond length of 1.271 (2) $\AA$ confirms its significant double-bond character. The $\mathrm{C} 9-\mathrm{N} 2$ and $\mathrm{N} 2-\mathrm{N} 3$ bond distances of 1.351 (2) and 1.3771 (18) Å, respectively, indicate a significant delocalization of the $\pi$-electron density over the hydrazone portion of the molecule. Variations in the $\mathrm{C}-\mathrm{N}$ bond lengths of 1.330 (2), 1.442 (2) and 1.351 (2) $\AA$ for $\mathrm{C} 7-\mathrm{N} 1, \mathrm{C} 8-\mathrm{N} 1$

Symmetry codes: (i) $-x+1,-y+1,-z$; (ii) $x+1, y, z$; (iii) $x, y, z+1$.
and $\mathrm{C} 9-\mathrm{N} 2$, respectively, characterize mobility of the bridge and the integral flexibility of the $-\mathrm{C}(=\mathrm{O})-\mathrm{NH}-\mathrm{CH}_{2} \mathrm{C}(=\mathrm{O})-$ $\mathrm{NH}-\mathrm{N}=\mathrm{CH}-$ group connecting the two benzene rings. The molecule is twisted at atom C 8 , the $\mathrm{C} 7-\mathrm{N} 1-\mathrm{C} 8-\mathrm{C} 9$ torsion angle being $79.8(2)^{\circ}$. The hydrazone part of the molecule is almost planar, with $\mathrm{C} 9-\mathrm{N} 2-\mathrm{N} 3-\mathrm{C} 10$ and $\mathrm{N} 2-\mathrm{N} 3-\mathrm{C} 10-$ C 11 torsion angles of -177.07 (15) and $179.38(14)^{\circ}$, respectively. Further, the dihedral angle between the almost planar hydrazone segment ( $\mathrm{O} 2 / \mathrm{N} 2 / \mathrm{N} 3 / \mathrm{C} 8-\mathrm{C} 11$; maximum deviation of 0.029 (1) $\AA$ for atom N 2 ) and the attached benzene ring ( $\mathrm{C} 11-\mathrm{C} 16$ ) is $8.17(6)^{\circ}$. The two benzene rings ( $\mathrm{C} 1-\mathrm{C} 6$ and $\mathrm{C} 11-\mathrm{C} 16)$ are orthogonal to each other, making a dihedral angle of $89.69(9)^{\circ}$. The planar amide segment (O1/N1/C1/C7/ C8; r.m.s. deviation $=0.009 \AA$ ) is inclined to the attached toluene ring (C1-C6) by 8.06 (9) $\AA$.

## 3. Supramolecular features

In the crystal of (I), the amide carbonyl O-atom, O1, shows bifurcated hydrogen bonding (Table 1 and Fig. 2); one with the

Figure 2
Hydrogen-bonding pattern in the title compound (see Table 1 for details). [Symmetry codes: (a) $-x+1,-y+1,-z$; (d) $x+1, y, z$; (e) $x, y, z+1$.]

Figure 3
A view along the $a$ axis of the crystal packing of the title compound. Hydrogen bonds are shown as dashed lines and $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions are represented as red arrows (see Table 1 for further details).
hydrazide hydrogen atom and the other with one of the hydrogen atoms of the water molecule (O3). The two hydrogen atoms of the water molecule are involved in hydrogen bonding with the O atoms of the amide carbonyl ( $\mathrm{O} 3-\mathrm{H} 31 \cdots \mathrm{O} 1$ ) and glycine carbonyl ( $\mathrm{O} 3-\mathrm{H} 32 \cdots \mathrm{O} 2$ ) groups of two different molecules of the title compound. The O atom is also involved in hydrogen bonding with the H atom of the carbonylamide group of a third symmetry-related molecule ( $\mathrm{N} 1-\mathrm{H} 1 N \cdots \mathrm{O} 3$ ). A pair of $\mathrm{N} 2-\mathrm{H} 2 N \cdots \mathrm{O} 1$ intermolecular hydrogen bonds link the molecules, forming inversion dimers, with an $R_{2}^{2}(14)$ ring motif. The dimers are further linked via hydrogen bonds involving the water molecule generating $R_{4}^{4}(14)$ and $R_{4}^{4}(18)$ ring motifs. Further, the N2$\mathrm{H} 2 N \cdots \mathrm{O} 1$ and $\mathrm{N} 1-\mathrm{H} 1 N \cdots \mathrm{O} 3$ hydrogen bonds between the molecules of the main compound and water molecules translate into $C_{2}^{2}(6)$ chains along the $a$-axis direction (Table 1 and Fig. 2) The chains are linked by a $\mathrm{C}-\mathrm{H} \cdots \mathrm{O}$ interaction, forming sheets parallel to (010). Within the sheets there are $\mathrm{C}-\mathrm{H} \cdots \pi$, and parallel slipped $\pi-\pi$ stacking interactions $\left[C g 2 \cdots C g 2^{i}=3.6458(12) \AA\right.$; inter-planar distance $=$ 3.4135 (8) $\AA$, slippage $=1.281 \AA ; C g 2$ is the centroid of ring C11-C16; symmetry code: (i) $-x+1,-y+1,-z+1$ ] involving inversion-related chlorobenzene rings; see Fig. 3.

## 4. Database survey

A search of the Cambridge Structural Database (Version 5.36, May 2015; Groom \& Allen, 2014) for the fragment $-\mathrm{NH}-\mathrm{CH}_{2}-$
$\mathrm{C}(=\mathrm{O})-\mathrm{NH}-\mathrm{N}=\mathrm{CH}-$, yielded only one hit, namely $\mathrm{N}-(2-$ hydroxy-1-naphthylmethylene)- $N^{\prime}$-( $N$-phenylglycyl)hydrazine (MEMTOO; Gudasi et al., 2006). A comparison of the structural details of the title compound, (I), with those of the recently published sulfonyl derivative, $(E)-N-\{2-[2-(3-c h l o r o-$ benzylidene)hydrazinyl]-2-oxoethyl\}-4-methylbenzenesulfonamide monohydrate (II) (Purandara et al., 2015), reveals the trans orientation of the amide group $(\mathrm{C} 1-\mathrm{C} 7(=\mathrm{O} 1) \mathrm{N} 1)$ and hydrazone segment $(\mathrm{N} 2-\mathrm{N} 3=\mathrm{C} 10-\mathrm{C} 11)$ with respect to the glycinyl $\mathrm{C} 8-\mathrm{C} 9$ bond in (I), as is evident from the $\mathrm{N} 1-\mathrm{C} 8-$ C9-N2 torsion angle of $173.58(15)^{\circ}$, in contrast to the cis orientation of the sulfonamide and hydrazone segments, with respect to the glycinyl $\mathrm{C}-\mathrm{C}$ bond, observed in compound (II). In the structure of (I), the benzene ring (C1-C6) is almost coplanar with the amide group [dihedral angle $=8.21(13)^{\circ}$ ]. This is in contrast to the L-shaped conformation (bent at the S atom) of the sulfonamide group with respect to the benzene ring in compound (II). The amide carbonyl O atom forms stronger $\mathrm{O}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds with the water H atoms than the sulfonyl O atom as observed in compound (II), indicating the stronger electron-withdrawing character of the amide group compared to the sulfonamide group.

## 5. Synthesis and crystallization

Triethylamine $(0.03 \mathrm{~mol})$ and 4-methylbenzoyl chloride ( 0.01 mol ) were added to a stirred suspension of glycine ethylester hydrochloride ( 0.01 mol ) in dichloromethane $(50 \mathrm{ml})$ in an ice bath. The reaction mixture was stirred at room temperature for 20 h . After completion of the reaction, $2 N$ hydrochloric acid ( 80 ml ) was added slowly. The organic phase was separated and washed with water ( 30 ml ), dried with anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated to yield the corresponding ester, $N$-(4-methylbenzoyl)glycine ethyl ester ( $L 1$ ). $L 1(0.01 \mathrm{~mol})$ was added in small portions to a stirred solution of $99 \%$ hydrazine hydrate ( 10 ml ) in 30 ml ethanol. The mixture was refluxed for 6 h . After cooling to room temperature, the resulting precipitate was filtered, washed with cold water and dried to give $N$-(4-methylbenzoyl)glycinyl hydrazide ( $L 2$ ). 2-Chlorobenzaldehyde ( 0.01 mol ) and two drops of glacial acetic acid were added to $L 2$ ( 0.01 mol ) in anhydrous methanol $(30 \mathrm{ml})$. The reaction mixture was refluxed for 8 h . After cooling, the precipitate was collected by vacuum filtration, washed with cold methanol and dried. It was recrystallized to constant melting point from methanol (479-480 K). Prism-like colourless single crystals of the title compound were grown from a solution in DMF by slow evaporation of the solvent.

The purity of the compound was checked by TLC and characterized by its IR spectrum. The characteristic absorptions observed are 3323.3, 3203.8, 1685.8, 1620.2 and $1566.2 \mathrm{~cm}^{-1}$ for the stretching bands of $\mathrm{N}-\mathrm{H}$ (amide I ), $\mathrm{N}-\mathrm{H}$ (amide II), $\mathrm{C}=\mathrm{O}$ (hydrazone), $\mathrm{C}=\mathrm{O}$ (amide) and $\mathrm{C}=\mathrm{N}$, respectively. The characteristic ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of the title compound are as follows: ${ }^{1} \mathrm{H}$ NMR $(400 \mathrm{MHz}$, DMSO- $d 6$, $\delta$ p.p.m.): $2.36(s, 3 H), 4.01,4.45(2 d, 2 H, J=5.8 \mathrm{~Hz}), 7.25(d$, $2 \mathrm{H}, \mathrm{Ar}-\mathrm{H}, J=8.0 \mathrm{~Hz}$ ), 7.33-7.40 ( $m, 2 \mathrm{H}, \mathrm{Ar}-\mathrm{H}$ ), 7.42-7.45 ( $m$,

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The water H atoms and the NH H
atoms were located in a difference Fourier map and refined with distances restraints: $\mathrm{O}-\mathrm{H}=0.85$ (2), $\mathrm{N}-\mathrm{H}=0.86$ (2) $\AA$ with $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{O})$ and $1.2 U_{\text {eq }}(\mathrm{N})$. The C-bound H atoms were positioned with idealized geometry and refined as riding atoms: $\mathrm{C}-\mathrm{H}=0.93-0.97 \AA$ Aith $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C})$ for methyl H atoms and $1.2 U_{\text {eq }}(\mathrm{C})$ for other H atoms.

## Acknowledgements

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors $(\mathrm{gt})$ etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$-factors based on ALL data will be even larger.

Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters ( $\hat{A}^{2}$ )

Hydrogen-bond geometry ( $A,{ }^{\circ}$ )
Cg 1 is the centroid of the toluene ring $\mathrm{C} 1-\mathrm{C} 6$.

| $D — \mathrm{H} \cdots A$ | $D-\mathrm{H}$ | $\mathrm{H} \cdots A$ | $D \cdots A$ | $D-\mathrm{H} \cdots A$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{O} 3 — \mathrm{H} 31 \cdots \mathrm{O} 1$ | $0.84(2)$ | $2.13(2)$ | $2.897(2)$ | $152(3)$ |
| $\mathrm{O} 3 — \mathrm{H} 32 \cdots \mathrm{O} 2^{\mathrm{i}}$ | $0.86(2)$ | $1.92(2)$ | $2.772(2)$ | $174(3)$ |
| $\mathrm{N} 1 — \mathrm{H} 1 N \cdots \mathrm{O}^{\mathrm{ii}}$ | $0.84(2)$ | $2.15(2)$ | $2.941(2)$ | $158(2)$ |
| $\mathrm{N} 2 — \mathrm{H} 2 N \cdots \mathrm{O}^{\mathrm{i}}$ | $0.87(2)$ | $2.09(2)$ | $2.944(2)$ | $165(2)$ |
| $\mathrm{C} 14 — \mathrm{H} 14 \cdots{ }^{\mathrm{i}} 2^{\mathrm{iii}}$ | 0.93 | 2.57 | $3.404(2)$ | 150 |
| $\mathrm{C} 15 — \mathrm{H} 15 \cdots \mathrm{Cg} 1^{\mathrm{iii}}$ | 0.93 | 2.89 | $3.793(2)$ | 165 |

Symmetry codes: (i) $-x+1,-y+1,-z$; (ii) $x+1, y, z$; (iii) $x, y, z+1$.
