Kurnakov Institute of General and Inorganic Chemistry, Russian Academy of Sciences, 31 Leninsky Prospect, Moscow 119991, Russian Federation. \*Correspondence e-mail: mmminyaev@mail.ru

In the title compound, [ $(^t\text{BuSiMe}_2\text{O})_2\text{MoO}_2(2,2'\text{-bipyridine})$ ] or  $[\text{Mo}(\text{C}_6\text{H}_{15}\text{O-Si})_2\text{O}_2(\text{C}_{10}\text{H}_8\text{N}_2)]$ , the Mo<sup>VI</sup> atom has a distorted octahedral environment with the siloxy substituents occupying the *trans* positions. The complex contains a rare  $(R_3\text{SiO})_2\text{MO}_2$  ( $M = \text{Mo}, \text{W}$ ) structural motif and was formed in a reaction between sodium molybdate and *tert*-butyldimethylsilyl chloride in the presence of 2,2-bipyridine. In the crystal, neighbouring molecules are linked by C—H···O=Mo hydrogen bonds, forming chains propagating along the *a*-axis direction.

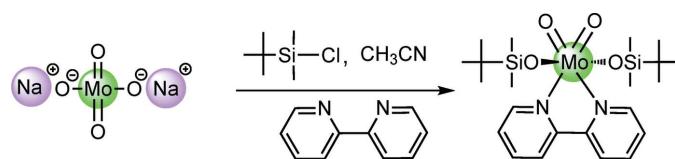

### 1. Chemical context

Bulky siloxy ligands are of interest as they can stabilize transition metal complexes with low coordination numbers, providing attractive structures and chemistry (Eppley *et al.*, 1991; Neithamer *et al.*, 1989; Huang & DeKock, 1993). The structural and reactivity studies of *cis*- $M^{\text{VI}}\text{O}_2$  and *cis*- $M^{\text{VI}}\text{OS}$  complexes ( $M = \text{Mo}, \text{W}$ ), including siloxy derivatives, are essential for understanding the activity of specific enzymes (Thapper *et al.*, 1999; Miao *et al.*, 2000). Both Mo<sup>VI</sup>O<sub>2</sub> and Mo siloxy derivatives have attracted attention as precursors, or as real catalytic species, in various catalytic applications (Heppekausen *et al.*, 2012; Arzoumanian *et al.*, 2008; Coelho *et al.*, 2011; Bruno *et al.*, 2006). Herein, we report on the crystal structure and synthesis of the title complex,  $(^t\text{BuSiMe}_2\text{O})_2\text{MoO}_2(\text{bipy})$  (I).

It was prepared by a one-pot reaction of sodium molybdate ( $\text{Na}_2\text{MoO}_4$ ) with 2,2-bipyridine (bipy) in acetonitrile followed by addition of *tert*-butyldimethylsilyl chloride (Fig. 1).

OPEN ACCESS

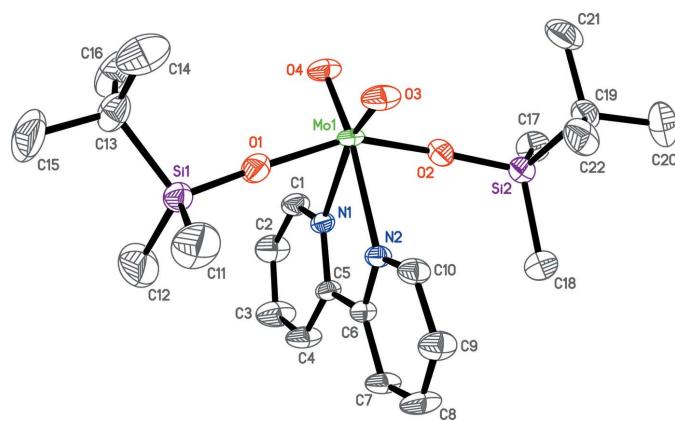

**Figure 1**  
Synthesis of  $(\text{BuSiMe}_2\text{O})_2\text{MoO}_2(2,2'\text{-bipyridine})$  (I).

## 2. Structural commentary

A view of the molecular structure of the 16-electron complex  $(\text{BuSiMe}_2\text{O})_2\text{MoO}_2(\text{bipy})$  (I) is given in Fig. 2, and selected geometrical parameters are given in Table 1. The bipy ligand is not planar, but instead twisted about the C5–C6 bond with a dihedral angle of  $9.76(14)^\circ$  between the two pyridine rings. The Mo environment resembles a distorted octahedron with the bulky siloxy ligands occupying the *trans* positions. The  $X\text{--Mo--}X$  bond angles lie in the ranges  $77.30(7)$ – $79.91(7)^\circ$  for  $\text{O}_{\text{Si}}\text{--Mo1--N}$ ,  $97.22(8)$ – $98.38(9)^\circ$  for  $\text{O}_{\text{Si}}\text{--Mo1--O}_{\text{Mo=O}}$ ,  $90.23(7)$ – $94.24(7)^\circ$  for  $\text{O}_{\text{Mo=O}}\text{--Mo1--N}$  (*cis*) and  $159.26(7)$ – $163.31(7)^\circ$  for  $\text{O}_{\text{Mo=O}}\text{--Mo1--N}$  (*trans*). The  $\text{Mo=O}$  double bonds are, as expected, shorter by *ca*  $0.20\text{ \AA}$  than the  $\text{Mo--O}_{\text{Si}}$  single bonds (Table 1), while the  $\text{Mo--N}$  bond lengths are the longest.

The  $\text{Mo--}X$  bond lengths in five known complexes of types  $(\text{Ph}_3\text{SiO})_2\text{MoO}_2(L)$  and  $(\text{Ph}_3\text{SiO})_2\text{MoO}_2(\text{py})_2$  (where  $L$  is a  $\kappa^2N,N'$ -coordinated ligand, py is pyridine; CSD refcodes are LEKCEL, SOKPAK, WIXCEL, WIXCIP and ZASHAE; see Section 4, Database survey below) vary from  $1.695$  to  $1.705\text{ \AA}$  for  $\text{Mo=O}$ ,  $1.923$  to  $1.939\text{ \AA}$  for  $\text{Mo--O}_{\text{Si}}$  and  $2.336$ – $2.407\text{ \AA}$  for  $\text{Mo--N}$ . Slightly shorter  $\text{Mo--O}$  bond lengths are found in the complexes  $(\text{Ph}_3\text{SiO})_2\text{MoO}_2(\text{PPh}_3)$  (PERGAU;  $1.678$  and  $1.678\text{ \AA}$  for  $\text{Mo=O}$ ,  $1.903$  and  $1.922\text{ \AA}$  for  $\text{Mo--O}_{\text{Si}}$ ) and  $(\text{Ph}_3\text{SiO})_2\text{MoO}_2$  (PERFUN;  $1.690\text{ \AA}$  for  $\text{Mo=O}$  and  $1.816\text{ \AA}$  for  $\text{Mo--O}_{\text{Si}}$ ), likely because of the reduced number of coordinated  $\sigma$ -donating atoms. The title complex exhibits similar  $\text{Mo=O}$  and  $\text{Mo--N}$  bond lengths to those in  $(\text{Ph}_3\text{SiO})_2\text{MoO}_2(L)$ , but the  $\text{Mo--O}_{\text{Si}}$  bond lengths are shorter by *ca*  $0.02\text{ \AA}$ , probably as a result of the lower steric influence of the

**Figure 2**  
The molecular structure of the title complex (I). Displacement ellipsoids are drawn at the 50% probability level and, for clarity, H atoms have been omitted.

Symmetry code: (i)  $x + 1, y, z$ .

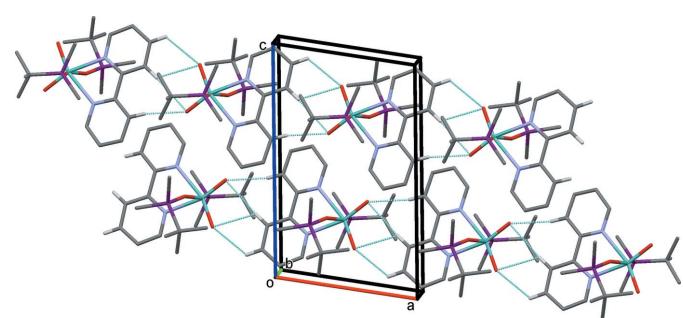

$\text{BuSiMe}_2\text{O}$  ligand than that of  $\text{Ph}_3\text{SiO}$ . The  $X\text{--Mo--}X$  bond angles in (I) and those in  $(\text{Ph}_3\text{SiO})_2\text{MoO}_2(L)$  are also similar.

## 3. Supramolecular features

In the crystal, neighbouring molecules are linked by  $\text{C--H}\cdots\text{O}=\text{Mo}$  hydrogen bonds, forming chains along the  $a$ -axis direction (Fig. 3 and Table 2). Similar  $\text{Mo}=\text{O}\cdots\text{H}_{\text{Ar}}$  interactions can be found in the  $(\text{Ph}_3\text{SiO})_2\text{MoO}_2(L)$  complexes mentioned above. Other non-valent intermolecular short contacts present in the structure of (I) are less significant.

## 4. Database survey

Crystal structures possessing the  $(R_3\text{SiO})_2M(=O)_2$  structural motif ( $M = \text{Cr}, \text{Mo}$  or  $\text{W}$ ;  $R$  is alkyl/aryl) are quite rare. Nine such structures have been described to date in the Cambridge Structural Database (CSD Version 5.39, latest update February 2018; Groom *et al.*, 2016), which have only  $R = \text{Ph}$ . There are two complexes of the type  $(\text{Ph}_3\text{SiO})_2\text{MO}_2$  without

**Figure 3**  
A view along the  $b$  axis of the crystal packing of the title complex (I). Only the H atoms involved in hydrogen bonding (dashed lines; see Table 2) are included.

additional σ-donors (*M* = Mo, CSD refcode PERFUN: Huang & DeKock, 1993; *M* = Cr, PSILCR: Stensland & Kierkegaard, 1970), two complexes with σ-donating monodentate ligands, *viz.* (Ph<sub>3</sub>SiO)<sub>2</sub>MoO<sub>2</sub>(PPh<sub>3</sub>) (PERGAU: Huang & DeKock, 1993), (Ph<sub>3</sub>SiO)<sub>2</sub>MoO<sub>2</sub>(py)<sub>2</sub> (py molecules *cis*; WIXCIP: Thapper *et al.*, 1999) and five (Ph<sub>3</sub>SiO)<sub>2</sub>MO<sub>2</sub>(*L*) complexes (where *M* = Mo and *W*; *L* is a κ<sup>2</sup>*N,N'*-bidentate ligand). They include (Ph<sub>3</sub>SiO)<sub>2</sub>MoO<sub>2</sub>(bipy) (LEKCEL: Heppekausen *et al.*, 2012), (Ph<sub>3</sub>SiO)<sub>2</sub>MoO<sub>2</sub>(4,4'-Bu<sub>2</sub>bipy) (SOKPAK: Arzoumanian *et al.*, 2008), (Ph<sub>3</sub>SiO)<sub>2</sub>MoO<sub>2</sub>(phen) (phen is 1,10-phenanthroline; WIXCEL: Thapper *et al.*, 1999), (Ph<sub>3</sub>SiO)<sub>2</sub>WO<sub>2</sub>(3,4,7,8-Me<sub>4</sub>phen)(MELGEP: Miao *et al.*, 2000) and (Ph<sub>3</sub>SiO)<sub>2</sub>MoO<sub>2</sub>(pzpy) (pzpy is 2-(1*H*-pyrazol-3-yl)pyridine; ZASHAE: Coelho *et al.*, 2011).

## 5. Synthesis and crystallization

The title Mo<sup>VI</sup> complex was synthesized by a modification of previously reported methods for an analogous complex (Huang & DeKock, 1993; Bruno *et al.*, 2006). Details of the synthesis are illustrated in Fig. 1. Under an argon atmosphere, a stirred mixture of anhydrous sodium molybdate (0.41 g, 2.0 mmol) and 2,2-bipyridine (0.310 g, 2.0 mmol) in CH<sub>3</sub>CN (15 ml) was cooled to 273 K and a solution of *tert*-butyl-dimethylsilyl chloride (0.603 g, 4.00 mmol) in CH<sub>3</sub>CN (10 ml) was slowly added. The obtained suspension was allowed to warm slowly to room temperature and was stirred overnight. All volatiles were removed under reduced pressure. The

residue was extracted with THF (50 ml) and filtered. The filtrates were concentrated and cooled to 248 K to afford colourless crystals of (I) (yield 0.850 g, 1.55 mmol, 78%).

<sup>1</sup>H NMR (CD<sub>2</sub>Cl<sub>2</sub>, 298 K) δ: -0.45 (*s*, 12H), 0.55 (*s*, 18H), 7.60 (*t*, 2H), 8.08 (*t*, 2H), 8.19 (*m*, 2H), 8.29 (*d*, 2H). <sup>13</sup>C{<sup>1</sup>H} NMR (CD<sub>2</sub>Cl<sub>2</sub>, 298 K) δ: -4.3, 19.5, 25.9, 122.0, 126.1, 139.8, 150.9. See the *Supporting information* for <sup>1</sup>H and <sup>13</sup>C{<sup>1</sup>H} NMR spectra. Analysis found (calculated for C<sub>22</sub>H<sub>38</sub>MoN<sub>2</sub>O<sub>4</sub>Si<sub>2</sub>): C 48.65 (48.33), H 7.30 (7.01), N 5.28% (5.12%).

## 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. All H atoms were found from difference-Fourier maps but positioned geometrically and refined as riding: C—H = 0.95–0.98 Å with U<sub>iso</sub>(H) = 1.5U<sub>eq</sub>(C-methyl) and 1.2U<sub>eq</sub>(C) for other H atoms. A rotating group model was applied for the methyl groups. Reflections 001, 010 and 011 were omitted from the refinement as they were affected by the beam stop.

 $(\Delta/\sigma)_{\max} = 0.001$

$$\Delta\rho_{\max} = 0.50 \text{ e } \text{\AA}^{-3}$$

$$\Delta\rho_{\min} = -0.76 \text{ e } \text{\AA}^{-3}$$

### Special details

**Experimental.** All synthetic manipulations were conducted under an argon atmosphere, using a dry box and standard Schlenk and vacuum line techniques. THF was predried over NaOH and distilled from potassium/benzophenoneketyl under argon. CH3CN was distilled from calcium hydride under argon. CD2Cl2 was carefully distilled from LiAlH4 and stored over 4?Å molecular sieves. The Mo complex was synthesized by a modification of previously reported methods for an analogous complex (Huang & DeKock, 1993; Bruno *et al.*, 2006). Elemental (C, H, N) analysis was performed with a PerkinElmer 2400 Series II elemental CHNS/O analyzer. NMR spectra were recorded with a Bruker AVANCE 400 spectrometer at 298K.

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
