Appendix 2: signaling questions to assess risk of bias based on CAD models

1. Were overfitting mitigation techniques used? If described then low risk of bias.
2. Was the training set different from the validation set? If yes then low risk of bias
3. Was cross-validation used? If yes then high risk of bias, because high risk of overfitting when used.
4. Was the dataset made public and reproducible? If yes then low risk of bias
5. Was the model validated in other centers? If yes then low risk of bias
6. Was the test set large enough with enough power? If yes then low risk of bias
7. Were the groups randomly determined? If yes then high risk of bias
8. Were the features analyzed and is analyzed whether the features were significant?
If yes then low risk of bias

Appendix 3: Meta-analysis results
