# One-pot construction of diverse and functionalized isochromenoquinolinediones by Rh (III)-catalyzed annulation of unprotected arylamides with 3diazoquinolinediones and their application for fluorescence sensor $\dagger$ 

Rajeev Shrestha, © $\ddagger$ Hari Datta Khanal $\ddagger$ and Yong Rok Lee (D) *

#### Abstract

A facile and efficient $\mathrm{Rh}($ (II)-catalyzed annulation of arylamides with 3-diazoquinolinediones for the construction of diverse and highly functionalized isochromenoquinolinediones is described. Furthermore, the methodology is applicable for delivering various relevant molecules such as pyridopyranoquinolindiones, thienopyranoquinolinones, and indolopyranoquinolinone. The reaction proceeds via cascade $\mathrm{C}-\mathrm{H}$ activation, carbene insertion, and intramolecular lactonization. The reaction exhibits high atom economy, good functional group tolerance, and high regioselectivity. The synthesized compound can also behave as a potent fluorescence sensor for $\mathrm{Fe}^{3+}$ ion.

## Introduction

Molecules bearing isochromenones or quinolinones are widely found in bioactive natural products, synthetic molecules, and pharmaceuticals. ${ }^{1,2}$ They are also used as valuable building blocks for the synthesis of medicines and functional materials. ${ }^{3,4}$ Among them, isochromenones containing a sixmembered lactone ring possess potent biological functions such as anticancer, antimicrobial, anti-inflammatory, anticoagulant, and anti-HIV activities (Fig. 1A). ${ }^{5}$ The nitrogencontaining heterocycles, quinolinones also have a broad range of biological properties including anticancer, antibiotic, antiviral, antibacterial, and antihypertensive activities (Fig. 1B). ${ }^{6}$

Owing to their importance and usefulness, various approaches for the synthesis of isochromenones or quinolinones have been developed. The typical methods for the preparation of isochromenones include nickel-catalyzed decarbonylative addition of anhydrides to alkynes, ${ }^{7} \mathrm{Rh}(\mathrm{III})-$ catalyzed reaction of phosphonium ylides or benzamides with diazocarbonyl compounds, ${ }^{8} \mathrm{~N}$-heterocyclic carbene/Lewis acidcatalyzed dimerization of 2 -formylcinnamates, ${ }^{9}$ and $\mathrm{Ru}(\mathrm{II})$ catalyzed electrooxidative [4+2] reaction of benzyl alcohols with alkynes. ${ }^{10}$ The representative strategies for the synthesis of

[^0]quinolinones include Rh-catalyzed $\mathrm{C}-\mathrm{H}$ bond activation of anilines with CO and alkynes, ${ }^{11}$ Rh-catalyzed decarbonylative coupling of isatins with alkynes, ${ }^{12}$ Ru-catalyzed cyclization of anilides with propiolates or acrylates, ${ }^{13}$ Pd-catalyzed cascade reaction of anilines with acrylates, ${ }^{14}$ direct oxidation $\mathrm{C}-\mathrm{H}$ amidation of amides. ${ }^{15}$ In addition, $\mathrm{Rh}($ (III $)$-catalyzed annulation of benzamides with diazo compounds for isoquinolinones was reported (Scheme 1a). ${ }^{16}$ Although a number of methods for the synthesis of isochromenones and quinolinones or isoquinolinones have been demonstrated, the direct construction of heterocycles bearing both isochromenones and quinolin-2ones are only reported sporadically. ${ }^{17}$ Recently, the reported $\operatorname{Pd}(\mathrm{II})$-catalyzed carbonylation of alkynes is one such example (Scheme 1b). ${ }^{17}$ However, there is no example for the direct construction of highly functionalized

isochromenoquinolinediones by Rh (iii)-catalyzed annulation of unprotected arylamides with 3-diazoquinolinediones.

As a part of our ongoing studies on the development of new synthetic methodologies for the construction of heterocycles utilizing diazo compounds, ${ }^{18}$ this paper describes an efficient Rh (III)-catalyzed annulation of unprotected arylamides, isonicotinamide, thiophene-2-carboxamide, and indole-3carboxamide with various 3 -diazoquinoline-2,4-diones for the construction of diverse and functionalized heterocycles bearing isochromenones and quinolinones (Scheme 1c).

## Results and discussion

Our investigation commenced with the reaction of primary benzamide (1a) with 3-diazo-1-methylquinoline-2,4-dione (2a) in the presence of different catalysts, additives, and solvents (Table 1). The initial reaction with $2.5 \mathrm{~mol} \%\left[\mathrm{RuCl}_{2}(p \text {-cymene })\right]_{2}$ and $20 \mathrm{~mol} \% \mathrm{Cu}(\mathrm{OAc})_{2}$ under reflux in 1,2-dichloroethane for 12 h provided the $\mathrm{N}-\mathrm{H}$ insertion product $\mathbf{3 a}^{\prime}(48 \%)$, along with a trace amount of 3 a (entry 1). However, with $2.5 \mathrm{~mol} \%$ of $\left[\mathrm{RhCp} * \mathrm{Cl}_{2}\right]_{2}$ and $20 \mathrm{~mol} \% \mathrm{Cu}(\mathrm{OAc})_{2}$, 3a was isolated in $64 \%$ yield as the sole product (entry 2 ). Importantly, $\left[\mathrm{RhCp} \mathrm{Cl}_{2}\right]_{2}$ showed superior catalytic activity than $\left[\operatorname{RuCl}_{2}(p \text {-cymene })\right]_{2}$ for the synthesis of $3 \mathbf{a}$. To our delight, an increase in the amount of $\mathrm{Cu}(\mathrm{OAc})_{2}$ to $100 \mathrm{~mol} \%$ improved the yield of 3a to $72 \%$ (entry 3). Encouraged by this result, we screened other additives such as CsOAc, $\mathrm{AgNO}_{3}, \mathrm{AgSbF}_{6}, \mathrm{Ag}_{2} \mathrm{CO}_{3}$, and AgOAc for this reaction, along with $2.5 \mathrm{~mol} \%\left[\mathrm{RhCp} \mathrm{Cl}_{2}\right]_{2}$ (entries $4-8$ ). Among these, AgOAc was found to be the best additive for this transformation. Importantly, increasing the amount of AgOAc to $200 \mathrm{~mol} \%$ not
only reduced the reaction time to 8 h , but also increased the yield of 3a to $84 \%$ (entry 9). However, decreasing the loading of AgOAc to $20 \mathrm{~mol} \%$ decreased the yield of 3 a to $52 \%$ (entry 10). In addition, decreasing the loading of $\left[\mathrm{RhCp}^{*} \mathrm{Cl}_{2}\right]_{2}$ to $1.0 \mathrm{~mol} \%$ in the presence of $200 \mathrm{~mol} \% \mathrm{AgOAc}$ provided 3 a in $70 \%$ yield (entry 11). However, decreasing the reaction temperature to room temperature did not afford any product (entry 12). On the other hand, 3a was not obtained in the absence of AgOAc or [RhCp* $\left.\mathrm{Cl}_{2}\right]_{2}$ (entries 13-14). Further reactions using other nonpolar or polar solvents such as toluene, 2,2,2-trifluoroethanol (TFE), acetonitrile, and ethanol provided 3a in lower yields (45-68\%) (entries 15-18). The structure of 3a was identified by the analysis of its spectral data. The ${ }^{1} \mathrm{H}$ NMR spectrum of 3a revealed the characteristic $N$-methyl peak at $\delta 3.80 \mathrm{ppm}$ and 8 aromatic proton peaks at $\delta 9.60,8.40,8.34$, $7.86,7.67,7.89,7.42$, and 7.35 ppm . The ${ }^{13} \mathrm{C}$ NMR spectrum of 3a exhibited peaks due to the carbonyl carbon of a conjugated lactone moiety at $\delta 160.7 \mathrm{ppm}$ and a conjugated amide carbonyl carbon at $\delta 160.2 \mathrm{ppm}$. The structure of $\mathbf{3 a}$ was further confirmed by single-crystal X-ray crystallographic analysis of the structurally related compound $3 \mathbf{j}$ (Fig. 2).

With the optimized conditions in hand, we further explored the generality of the reactions by employing diversely substituted 3 -diazoquinoline-2,4-diones $2 \mathbf{b - 2 0}$ (Table 2). The reactions of 1 a with $N$-substituted 3-diazoquinoline-2,4-diones 2b-2h bearing $N$-chloropropyl, $N$-but-3-en-1-yl, $N$-benzyl, $N$ allyl, $N$-prenyl, $N$-cinnamyl, and $N$-trans,trans-farnesyl groups were successfully carried out to produce the desired products $3 \mathbf{b}-3 \mathbf{h}$ in $62-82 \%$ yields. In addition, reactions of other 3-diazoquinolindiones $2 \mathbf{i}-20$ bearing various substituents on the

Table 1 Optimization of the reaction conditions ${ }^{a}$

${ }^{a}$ Reaction conditions: $\mathbf{1 a}(0.5 \mathrm{mmol})$, 2a $(0.5 \mathrm{mmol})$ in solvent $(5 \mathrm{~mL})$ under $\mathrm{N}_{2} .{ }^{b}$ Isolated yields after column chromatography.
benzene ring were successful. Treatment of $\mathbf{1 a}$ with 3 -diazo- $N$ methylquinolindione compounds $\mathbf{2 i} \mathbf{i} \mathbf{2 k}$ bearing electrondonating groups such as $6-\mathrm{Me}, 6-\mathrm{i}-\mathrm{Pr}$, and $7-\mathrm{OMe}$ provided the desired products $3 \mathbf{i}-3 \mathbf{k}$ in $74 \%, 81 \%$, and $68 \%$ yields, whereas that with diazo compounds 2l-2o bearing electron-withdrawing groups such as $5-\mathrm{Cl}, 6-\mathrm{Cl}, 6-\mathrm{Br}$, and $7-\mathrm{Cl}$ afforded the corresponding products $31-30$ in $79-85 \%$ yields.

To demonstrate the versatility of this protocol, further reactions of various benzamides $\mathbf{1 b} \mathbf{- 1 m}$ with 3 -diazo- $N$ -methylquinoline-2,4-dione (2a) were investigated (Table 3). Treatment of $\mathbf{2 a}$ with benzamides $\mathbf{1 b} \mathbf{- 1 d}$ bearing electrondonating groups such as $4-\mathrm{Me}, 4-\mathrm{OMe}$, and $4-\mathrm{Ph}$ on the

Fig. 2 X-ray structure of compound 3 j (CCDC 1878962).
benzene ring provided $\mathbf{4 a}-\mathbf{4 c}$ in $75 \%, 72 \%$, and $78 \%$ yields, respectively, whereas the reactions with benzamides $\mathbf{1 e} \mathbf{- 1 i}$ bearing electron-withdrawing groups such as $4-\mathrm{Cl}, 4-\mathrm{Br}, 4-$ COMe, $4-\mathrm{CO}_{2} \mathrm{Me}$ and $4-\mathrm{CN}$ afforded $\mathbf{4 d}-\mathbf{4 h}$ in $62-86 \%$ yields. However, the reaction of $\mathbf{1 j}$ bearing a strong electronwithdrawing $-\mathrm{NO}_{2}$ group at 4-position of the benzene ring did not afford the expected product $\mathbf{4 i}$. On the other hand, the reactions of ortho-substituted benzamides $\mathbf{1 k}$ and 11 with $\mathbf{2 a}$ afforded the desired products $\mathbf{4 j}$ and $\mathbf{4 k}$ in $\mathbf{7 6 \%}$ and $74 \%$ yields, respectively. In addition, when 3,4 -dichlorobenzamide (1m) bearing two electron-withdrawing groups on the benzene ring was allowed to react with $2 \mathbf{a}$, the desired product $4 \mathbf{l}$ was produced in $84 \%$ yield. In this case, other possible regioisomers were not observed.

After demonstrating the generality and versatility of this methodology, we investigated the possibility of using other arylamides $\mathbf{1 n} \mathbf{- 1 p}$ bearing polyaromatic and heteroatomic rings with diazo compounds (Scheme 2). For example, the reaction of 2-naphthamide (1n) with 2a or 2d provided 5 and 6 in $76 \%$ and $71 \%$ yields, respectively, while that of isonicotinamide (10) bearing a N -heteroaromatic ring with 2 a or $2 \mathbf{l}$ afforded the desired products 7 and 8 in $48 \%$ and $58 \%$ yields, respectively. On the other hand, treatment of thiophene-2-carboxamide ( $\mathbf{1 p}$ ) bearing an S-heteroaromatic ring with $\mathbf{2 a}$ or $\mathbf{2 j}$ led to the formation of the expected products 9 and 10 in $62 \%$ and $63 \%$ yields, respectively.

Table 2 Synthesis of diverse fused isochromenoquinolinediones 3b30 by the reaction of $1 a$ with $2 b-20$

As an application of this protocol, diversely oriented polycyclic heterocycle 11 was next prepared in $62 \%$ yield employing 1-methyl-1H-indole-3-carboxamide (1q) with diazo compound $2 \mathbf{2 a}$ under standard reaction conditions (Scheme 3).

The chemoselectivity of the reactions of different benzamides with diazo compound 2a was investigated under standard conditions (Scheme 4). Treatment of two different benzamides 1a ( 0.5 mmol ) and $\mathbf{1 c}(0.5 \mathrm{mmol})$ with diazo compound $2 \mathbf{a}$ ( 0.5 mmol ) for 8 h afforded the products $3 \mathbf{a}$ and $\mathbf{4 b}$ in $40 \%$ and $28 \%$ yields, respectively (Scheme 4 , eqn (1)). On the other hand, the reaction of benzamides $\mathbf{1 a}(0.5 \mathrm{mmol})$ and 1f ( 0.5 mmol ) afforded $3 \mathbf{a}$ and $4 \mathbf{e}$ in $37 \%$ and $42 \%$ yields,

benzamide 1a and the benzamide $\mathbf{1 c}$ bearing electron-donating groups.

To elucidate the reaction mechanism, some deuterium labelling experiments were performed (Scheme 5). The H/D exchange experiment was first carried out with $2.5 \mathrm{~mol} \%$ Rh (iii) and AgOAc (2 equivalents) of 1a (Scheme 5a). A significant deuterium exchange ( $65 \%$ ) was observed at each of the two ortho positions of the benzamide to afford the product $1 \mathbf{1 a}^{\prime} .^{19 a}$ This result suggested that the rhodation-proto(deuterio)derhodation process is reversible at the ortho positions. A kinetic isotope effect (KIE) experiment was next carried out (Scheme 5b). ${ }^{19 b} \mathrm{~A}$ significant primary KIE value ( $K_{\mathrm{H}} / K_{\mathrm{D}}=3.5$ ) was observed via ${ }^{1} \mathrm{H}$ NMR analysis, which indicated that $\mathrm{C}-\mathrm{H}$ bond cleavage occurs during the rate-determining step.

On the basis of the control experiments and available literature, ${ }^{20}$ a plausible mechanism for the formation of 3 a is depicted in Scheme 6. Initially, an active catalyst $\left[\mathrm{RhCp} *(\mathrm{OAc})_{2}\right]$ is generated through anion exchange from $\left[\mathrm{RhCp} \mathrm{Cl}_{2}\right]_{2}$ and AgOAc. A coordination reaction between the activated catalyst

Scheme 5 Deuterium labelling experiments.

Scheme 6 Reaction mechanism for the formation of 3a.
and 1a gives rhodacyclic intermediate $\mathbf{A}$ via a concerted metalation/deprotonation pathway. Then, diazo compound $2 \mathbf{2 a}$ reacts with intermediate $\mathbf{A}$ to form carbene intermediate $\mathbf{B}$ through the release of nitrogen. Subsequently, the migratory insertion of the carbene group into the $\mathrm{Rh}-\mathrm{C}$ bond delivers the eight membered rhodacycle intermediate $\mathbf{C}$ that is protonated

Fig. 3 (a) Fluorescence responses of different compounds ( $10 \mu \mathrm{M}, \lambda_{\text {ex }}$ $=350 \mathrm{~nm}$ ). (b) Fluorescence responses of 4 a in the presence of various metal cations ( $10 \mu \mathrm{M}, \lambda_{\mathrm{ex}}=350 \mathrm{~nm}$ ).

Fig. 4 (a) Fluorescence spectra of $4 a$ in the presence of different concentrations of aqueous $\mathrm{Fe}^{3+}(100$ to $900 \mu \mathrm{M}$ ). (b) Plot of quenching efficiency versus the concentration of $\mathrm{Fe}^{3+}$ ions.
by AcOH to yield the intermediate $\mathbf{D}$, with regeneration of Rh (iii) catalyst for the next catalytic cycle. Finally, rapid lactonization of $\mathbf{D}$ furnishes 3a. ${ }^{21}$

The synthesized compounds were evaluated as fluorescent sensor for sensing $\mathrm{Fe}^{3+}$ ions. Currently, the use of fluorescent molecular probes emitting in the visible region has become quite significant and have attracted considerable attention in academic and industrial research. ${ }^{22}$ Initially, the compound $4 \mathbf{4}$ $(10 \mu \mathrm{M})$ was optimized in seven different solvents: 1,4-dioxane, dimethyl sulfoxide (DMSO), 1,2-dichloroethane (DCE), acetonitrile (ACN), dichloromethane (DCM), tetrahydrofuran (THF) and ethanol (EtOH) (Fig. S1 $\dagger$ ). Among these solvents, the compound $\mathbf{4 a}$ in 1,4-dioxane emitted the highest florescence maximum at 395 nm wavelength with intensity 3725 a.u. upon excitation at 350 nm . Hence, we examined the fluorescent properties of some of the synthesized compounds, viz. $\mathbf{3 a}, \mathbf{3 g}, \mathbf{3 j}$, 3l, 4a, 4c, 4d, 5, 7, and 10 in 1,4-dioxane.

Interestingly, compound $\mathbf{4 a}$ emitted the highest fluorescence intensity amongst all the compounds examined (Fig. 3a). Therefore, the fluorescence response of $10 \mu \mathrm{M} 4 \mathrm{a}$ was recorded against various metal ions in water (Fig. 3b). Indeed, as indicated in Fig. 3b, among the different metal ions, the compound $\mathbf{4 a}$ selectively sensed $\mathrm{Fe}^{3+}$. Following this, the fluorescence response of $\mathbf{4 a}$ (excitation at 350 nm ) was examined against various concentrations of $\mathrm{Fe}^{3+}(100$ to $900 \mu \mathrm{M})$ in water (Fig. 4a). The fluorescent intensity of compound $\mathbf{4 a}$ was quenched linearly by increasing $\mathrm{Fe}^{3+}$ concentration with a correlation coefficient $\left(R^{2}\right)$ of 0.9961 (Fig. 4b). Hence, the
compound 4a can be utilized as a potent fluorescence sensor for $\mathrm{Fe}^{3+}$ ions.

## Conclusions

In conclusion, we have developed an efficient protocol for the $\mathrm{Rh}(\mathrm{III})$-catalyzed direct annulation of unprotected arylamides, isonicotinamide, thiophene-2-carboxamide, and indole-3carboxamide with various 3-diazoquinoline-2,4-diones to synthesize various isochromenoquinolinediones, pyridopyranoquinolinediones, thienopyranoquinolineones, and indolopyranoquinolinedione that can be widely used as a significant building block for the synthesis of bioactive natural products and pharmaceuticals. This protocol provides a rapid access to fused analogs of isochromenones as a one-pot procedure, and has several advantages such as high atom economy, high regioselectivity, and good tolerance of various functional groups with good yields. In addition, the synthesized compounds showed potent turn-off fluorescence sensing for $\mathrm{Fe}^{3+}$ ion.

## Experimental

## General information

All the reactions were carried out under nitrogen atmosphere in a 25 mL two-necked round-bottom flask with magnetic stirring. Merck silica gel plates (Art. 5554) precoated with a fluorescent indicator were used for analytical TLC analysis. Flash column chromatography was performed using silica gel 9385 (Merck). Melting points were determined using micro-cover glasses on a Fisher-Johns apparatus and are uncorrected. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Varian VNS ( 600 MHz and 150 MHz , respectively) spectrometers in $\mathrm{CDCl}_{3}$. Chemical shifts for protons were reported as parts per million in $\delta$ scale using solvent residual peak $\left(\mathrm{CHCl}_{3}: 7.24 \mathrm{ppm}\right)$ as internal standard. Chemical shifts of ${ }^{13} \mathrm{C}$ NMR spectra were reported in ppm from the central peak of $\mathrm{CDCl}_{3}$ ( 77.00 ppm ) on the $\delta$ scale. Fourier transform infrared (FT-IR) spectra were recorded on a PerkinElmer FT-IR spectrometer Spectrum Two ${ }^{\mathrm{TM}}$. High-resolution mass spectra (HRMS) were obtained with a JEOL JMS-700 spectrometer at the Korea Basic Science Institute.

## General procedure for the synthesis of isochromenoquinolinone, pyridopyranoquinolinone, thienopyranoquinolinone, and indolopyranoquinolinone derivatives (3-11)

In an oven dried two-necked flask, a mixture of benzamide 1 ( 0.5 mmol ) and 3 -diazo- $N$-substituted quinoline-2,4-dione 2 ( 0.5 mmol ) were dissolved in DCE ( 5 mL ). This was then followed by addition of $\left[\mathrm{RhCp}^{*} \mathrm{Cl}_{2}\right]_{2}$ ( $2.5 \mathrm{~mol} \%$ ), and AgOAc ( 2.0 equiv.) under nitrogen atmosphere. The reaction mixture was stirred under reflux condition, and the progress of the reaction was followed by TLC analysis. After completion, the reaction mixture was cooled to room temperature. The volatiles were removed in vacuo and the residue was purified by silica gel column chromatography (Hex: EtOAc $=1: 5$ ) to obtain the desired products 3-11.

HRMS $m / z\left(M^{+}\right)$: calcd for $\mathrm{C}_{21} \mathrm{H}_{13} \mathrm{NO}_{3}: 327.0895$; found: 327.0897.

14-Benzyl-6H-benzo[6,7]isochromeno[4,3-c]quinoline-6,13(14H)dione (6). Yield: $71 \%$ ( 143 mg ); white solid; $\mathrm{mp}: 116-118{ }^{\circ} \mathrm{C}$. IR (ATR): 2880, 1839, 1657, 1600, 1493, 1352, 1256, 1127, 1070, $963 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 10.04(1 \mathrm{H}, \mathrm{s}), 8.95(1 \mathrm{H}, \mathrm{s})$, $8.29(1 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz}), 7.98-7.94(2 \mathrm{H}, \mathrm{m}), 7.59(1 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz})$, $7.52(1 \mathrm{H}, \mathrm{t}, J=6.6 \mathrm{~Hz}), 7.46(1 \mathrm{H}, \mathrm{t}, J=7.8 \mathrm{~Hz}), 7.20-7.24(4 \mathrm{H}, \mathrm{m})$, 7.19-7.17 (3H, m), $5.62(2 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 161.0$, $160.5,154.0,138.4,136.9,136.3,132.4,132.3,132.1,129.6,129.3$, 129.2, 129.0, 128.5, 127.5, 127.4, 127.3, 126.4, 124.1, 122.9, 118.5, 115.0, 114.0, 105.1, 46.4. HRMS $m / z\left(M^{+}\right):$calcd for $\mathrm{C}_{27} \mathrm{H}_{17} \mathrm{NO}_{3}$ : 403.1208; found: 403.1206.

6-Methyl-5H-pyrido[ $\left.3^{\prime}, 4^{\prime}: 4,5\right]$ pyrano[3,2-c]quinoline-5,12(6H)dione (7). Yield: $48 \%(66 \mathrm{mg})$; brown solid; $\mathrm{mp}: 270-272{ }^{\circ} \mathrm{C}$. IR (ATR): 2917, 1746, 1639, 1462, 1352, 1254, 1104, 1044, 973, $843 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 10.84(1 \mathrm{H}, \mathrm{s}), 8.90(1 \mathrm{H}, \mathrm{d}$, $J=1.2 \mathrm{~Hz}), 8.27(1 \mathrm{H}, \mathrm{d}, J=7.8 \mathrm{~Hz}), 8.13(1 \mathrm{H}, \mathrm{d}, J=3.6 \mathrm{~Hz}), 7.70-$ $7.68(1 \mathrm{H}, \mathrm{m}), 7.42(1 \mathrm{H}, \mathrm{d}, J=9.0 \mathrm{~Hz}), 7.35(1 \mathrm{H}, \mathrm{t}, J=7.8 \mathrm{~Hz}), 3.80$ $(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 159.8,158.5,155.6,149.2$, 147.9, 139.5, 133.5, 126.8, 124.1, 123.1, 121.7, 114.5, 113.1, 103.2, 29.9. HRMS $m / z\left(M^{+}\right)$: calcd for $\mathrm{C}_{16} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O}_{3}$ : 278.0691; found: 278.0694.

8-Chloro-6-methyl-5H-pyrido[ $\left.3^{\prime}, 4^{\prime}: 4,5\right]$ pyrano[3,2-c]quinoline-5,12(6H)-dione (8). Yield: $58 \%(90 \mathrm{mg})$; brown solid; mp: 289$291{ }^{\circ} \mathrm{C}$. IR (ATR): 3080, 1765, 1599, 1540, 1486, 1445, 1397, 1251, $1125,940 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 10.81(1 \mathrm{H}, \mathrm{s}), 8.90$ $(1 \mathrm{H}, \mathrm{d}, J=2.7 \mathrm{~Hz}), 8.14(1 \mathrm{H}, \mathrm{d}, J=2.4 \mathrm{~Hz}), 7.52(1 \mathrm{H}, \mathrm{t}, J=4.2 \mathrm{~Hz})$, 7.37-7.35 (2H, m), $3.80(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 159.2,157.8,155.2,150.1,148.9,141.4,132.6,132.3,128.5$, 127.1, 126.0, 120.8, 113.5, 111.0, 104.3, 30.8. HRMS $m / z\left(\mathrm{M}^{+}\right):$ calcd for $\mathrm{C}_{16} \mathrm{H}_{9} \mathrm{ClN}_{2} \mathrm{O}_{3}: 312.0302$; found: 312.0289.

5-Methyl-4H-thieno[ $\left.3^{\prime}, 2^{\prime}: 4,5\right]$ pyrano[3,2-c]quinoline-4,11(5H)dione (9). Yield: $62 \%(87 \mathrm{mg})$; brown solid; $\mathrm{mp}: 266-268{ }^{\circ} \mathrm{C}$. IR
(ATR): 2924, 2857, 1789, 1657, 1602, 1525, 1428, 1389, 1384, 1339, $1120,1093,988 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 8.52(1 \mathrm{H}, \mathrm{d}, J$ $=4.8 \mathrm{~Hz}), 8.32(1 \mathrm{H}, \mathrm{d}, J=8.4 \mathrm{~Hz}), 7.96(1 \mathrm{H}, \mathrm{d}, J=4.8 \mathrm{~Hz}), 7.66$ $(1 \mathrm{H}, \mathrm{t}, J=7.8 \mathrm{~Hz}), 7.42(1 \mathrm{H}, \mathrm{d}, J=8.4 \mathrm{~Hz}), 7.35(1 \mathrm{H}, \mathrm{t}, J=7.8 \mathrm{~Hz})$, $3.79(3 \mathrm{H}, \mathrm{m}) .{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 159.6,156.1,155.8$, 144.4, 138.9, 137.4, 132.5, 127.2, 124.1, 123.6, 123.0, 114.5, 113.7, 105.8, 29.7. HRMS $m / z\left(M^{+}\right)$: calcd for $\mathrm{C}_{15} \mathrm{H}_{9} \mathrm{NO}_{3} \mathrm{~S}: 283.0303$; found: 283.0300 .

8-Isopropyl-5-methyl-4H-thieno[ $\left.3^{\prime}, 2^{\prime}: 4,5\right]$ pyrano[3,2-c]quino-line-4,11(5H)-dione (10). Yield: 63\% (102 mg); white solid; mp: $255-257^{\circ} \mathrm{C}$. IR (ATR): 2961, 1730, 1643, 1582, 1422, 1375, 1244, $1037,960 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 8.53(1 \mathrm{H}, \mathrm{d}, J=5.4$ $\mathrm{Hz}), 8.15(1 \mathrm{H}, \mathrm{d}, J=1.8 \mathrm{~Hz}), 7.96(1 \mathrm{H}, \mathrm{d}, J=5.4 \mathrm{~Hz}), 7.55(1 \mathrm{H}$, $\mathrm{dd}, J=8.4,1.8 \mathrm{~Hz}$ ), $7.35(1 \mathrm{H}, \mathrm{d}, J=8.4 \mathrm{~Hz}), 3.77(3 \mathrm{H}, \mathrm{m}), 3.08-$ $3.01(1 \mathrm{H}, \mathrm{m}), 1.32(6 \mathrm{H}, \mathrm{d}, J=7.2 \mathrm{~Hz}) .{ }^{13} \mathrm{C}$ NMR ( 150 MHz , $\mathrm{CDCl}_{3}$ ): $\delta 159.5,156.3,155.9,144.6,143.8,137.3,131.4,127.2$, 123.6, 121.2, 114.5, 113.6, 105.7, 33.7, 29.7, 24.0. HRMS m/z $\left(\mathrm{M}^{+}\right)$: calcd for $\mathrm{C}_{18} \mathrm{H}_{15} \mathrm{NO}_{3} \mathrm{~S}$ : 325.0773; found: 325.0771.

2,13-Dimethyl-2,13-dihydroindolo $\left[2^{\prime}, 3^{\prime}: 4,5\right]$ pyrano[3,2-c] quinoline-1,8-dione (11). Yield: $62 \%(102 \mathrm{mg})$; white solid; $\mathrm{mp}: 296-298{ }^{\circ} \mathrm{C}$. IR (ATR): 2951, 1728, 1644, 1611, 1588, 1557, 1522, 1498, 1458, 1386, 1307, 1276, 1130, $1012 \mathrm{~cm}^{-1}$. ${ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 8.44(1 \mathrm{H}, \mathrm{d}, J=8.4 \mathrm{~Hz}), 8.31$ $(1 \mathrm{H}, \mathrm{d}, J=7.8 \mathrm{~Hz}), 7.67(1 \mathrm{H}, \mathrm{t}, J=7.2 \mathrm{~Hz}), 7.53(1 \mathrm{H}, \mathrm{d}, J=8.4$ $\mathrm{Hz}), 7.46(1 \mathrm{H}, \mathrm{t}, J=7.2 \mathrm{~Hz}), 7.42-7.38(2 \mathrm{H}, \mathrm{m}), 7.36(1 \mathrm{H}, \mathrm{t}, J=$ $7.8 \mathrm{~Hz}), 4.34(3 \mathrm{H}, \mathrm{s}), 3.84(3 \mathrm{H}, \mathrm{s}) .{ }^{13} \mathrm{C}$ NMR ( $150 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 159.0,157.2,157.0,142.5,141.0,139.2,132.7,125.3,124.9$, 124.2, 123.2, 122.9, 121.2, 114.4, 114.21, 110.6, 103.0, 102.3, 36.4, 30.0. HRMS $m / z\left(M^{+}\right)$: calcd for $\mathrm{C}_{20} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{3}$ : 330.1004; found: 330.1005 .

Fluorescence sensing of compound 4a on $\mathrm{Fe}^{3+} .0 .50 \mathrm{~mL}$ of compound $\mathbf{4 a}(10 \mu \mathrm{M})$ in 1,4-dioxane was taken in a 4 mL quartz cuvette as a fluorescent probe and was titrated with 0.50 mL of various metal ions $(100 \mu \mathrm{M})$ in water for selectivity studies. Further, the fluorescence sensitivity of compound $\mathbf{4 a}(10 \mu \mathrm{M})$ was studied towards different concentrations of $\mathrm{Fe}^{3+}$ in water. All the fluorescence (Hitachi-7000 F) measurements were carried out after 5 min of incubation at room temperature at 350 nm (excitation wavelength) with 5 nm of slit width, 250 V of photomultiplier tube voltage and a scan speed of $240 \mathrm{~nm} \mathrm{~min}{ }^{-1}$.
