Received 29 March 2010; accepted 4 May 2010

Key indicators: single-crystal X-ray study; $T = 291\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; R factor = 0.051; wR factor = 0.119; data-to-parameter ratio = 12.9.

In the title dinuclear nickel(II) complex, $[\text{Ni}_2(\text{C}_8\text{H}_4\text{FO}_3)_2(\text{H}_2\text{O})_4]\text{Cl}_2$, synthesized by the reaction between 4-fluoro-2,6-diformylphenol and nickel(II) chloride in methanol, the coordination cation is located on an inversion center and the Ni^{II} atom adopts a slightly distorted octahedral coordination geometry. The two Ni atoms are bridged by two phenolate O atoms and the intramolecular $\text{Ni}\cdots\text{Ni}$ distance is $3.0751(9)\text{ \AA}$. The crystal structure is stabilized by $\text{O}-\text{H}\cdots\text{Cl}$ hydrogen bonds.

Bis(μ -4-fluoro-2,6-diformylphenolato)bis[diaquanickel(II)] dichloride

Y. Zheng, S.-R. Li, H. Zhou, Z.-Q. Pan and Y.-Z. Li

Comment

Phenoxide-bridged dinuclear complexes have been extensively studied for several decades, most of them were derived from the cyclocondensation of 2,6-diformyl-4-R-phenol and alkyldiamine in the presence of metal ions (Thompson *et al.*, 1996; Zhou *et al.*, 2005; Raimondi *et al.*, 2004). With short distances between the two metal ions in the complexes, they show special electrical and magnetic properties (Mohanta *et al.*, 1998; Wang *et al.*, 1997). Adhikary *et al.* reported a phenoxide-bridged dinuclear nickel(II) complex, obtained directly from the mixture of 2,6-diformyl-4-methyl-phenol and nickel(II) perchlorate (Adhikary *et al.*, 1987). Here we report the crystal structure of a new dinuclear Ni^{II} complex with fluorine substituent in the phenyl ring. The difference between the title complex and the one Adhikary reported is that they have different substituents in the phenyl ring and different counter-anions.

The coordination cation consists of two 2,6-diformyl-4-fluorophenolate ligands, four water molecules, two Ni^{II} ions (Fig. 1). The chlorine ions do not participate in coordination to the Ni atoms. Each Ni atom has a slightly distorted octahedral coordination geometry and it deviates from the equatorial plane defined by four coordinating oxygen atoms of the organic ligand by 0.0266 (4) Å. The axial positions are occupied by two water molecules with Ni—O distances of 2.057 (4) Å and 2.067 (4) Å. The Ni—O distance in the basal plane is in the range of 1.995 (4) Å - 2.019 (3) Å. The presence of the two bridging phenolate O atoms gives rise to a short metal-metal contact of 3.0751 (9) Å that is slightly longer than those of binuclear nickel(II) complexes with macrocyclic phenoxy-bridging ligands (Zhou *et al.*, 2007).

Experimental

2, 6-Diformyl-4-fluorophenol was prepared according to the literature method (Taniguchi, 1984). To a solution of 2,6-diformyl-4-fluorophenol (1 mmol, 0.17 g) in absolute methanol (10 ml) was added a methanol solution (10 ml) containing NiCl₂H₂O (1 mmol, 0.17 g). The solution was stirred vigorously for 24 h at room temperature and filtrated. The dark-green block-shaped crystals suitable for X-ray diffraction analysis were obtained by slow evaporation of solvent over a period of two weeks.

Refinement

The H atoms of water molecules were found in a difference Fourier map, and the O—H distances were restrained to 0.85 (1) Å; their temperature factor was set to 1.2U_{eq}(O). All other H atoms were placed in calculated positions with C—H = 0.93 Å and included in the refinement in the riding-model approximation with U(H) set to 1.2U_{eq}(C).

Data collection

Bruker SMART APEX CCD diffractometer	2018 independent reflections
Radiation source: sealed tube graphite	1708 reflections with $I > 2\sigma(I)$
phi and ω scans	$R_{\text{int}} = 0.041$
Absorption correction: multi-scan (SADABS; Sheldrick, 1996)	$\theta_{\text{max}} = 26.0^\circ, \theta_{\text{min}} = 2.7^\circ$
$T_{\text{min}} = 0.603, T_{\text{max}} = 0.672$	$h = -10 \rightarrow 7$
5827 measured reflections	$k = -15 \rightarrow 16$
	$l = -8 \rightarrow 12$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.051$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.119$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.05$	$w = 1/[\sigma^2(F_{\text{o}}^2) + (0.06P)^2 + 1.99P]$
2018 reflections	where $P = (F_{\text{o}}^2 + 2F_{\text{c}}^2)/3$
157 parameters	$(\Delta/\sigma)_{\text{max}} < 0.001$
	$\Delta\rho_{\text{max}} = 0.42 \text{ e \AA}^{-3}$

4 restraints

$$\Delta\rho_{\min} = -0.94 \text{ e \AA}^{-3}$$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
