#### Abstract

Dihydropyrimidines (DPs) show a wide range of biological activities for medicinal applications. Among the DP derivatives, 2-aryl-DPs have been reported to display remarkable pharmacological properties. In this work, we describe a method for the synthesis of hitherto unavailable 6 -unsubstituted 2 -aryl-DPs by Pd-catalyzed/Cu-mediated carbon-carbon cross-coupling reaction of 1-Boc 2-methylthio-DPs with organostannane reagents. The Boc group of the substrate significantly increases the substrate reactivity. Aryl tributylstannanes having various substituents such as $\mathrm{MeO}, \mathrm{Ph}, \mathrm{CF}_{3}, \mathrm{CO}_{2} \mathrm{Me}$, and $\mathrm{NO}_{2}$ groups smoothly afforded the corresponding products in high yields. Various heteroaryl tributylstannanes having 2-, or 3-thienyl, 2-, or 3-pyridinyl groups were also applicable to the reaction. Regarding the substituents at the 4-position, the reactions of DPs bearing various aryl and alkyl substituents proceeded smoothly to give the desired products. The Boc group of the products was removed under a standard acidic condition to produce $N$-unsubstituted DP as a mixture of the tautomers in quantitative yields. The synthetic procedure was also applied to 4,4,6-trisubstituted 2-methylthio-DP to give novel 2,4,4,5,6pentasubstituted DP. Therefore, the Pd-catalyzed/Cu-mediated reaction should help expand the DPbased molecular diversity, which would impact biological and pharmacological studies.

## Introduction

Dihydropyrimidines (DPs) show a wide range of biological activities for medicinal applications. They display calcium channel inhibitory, ${ }^{1}$ anticancer, ${ }^{2}$ antibacterial, ${ }^{3}$ antifungal, ${ }^{4}$ anti-HIV, ${ }^{5}$ antimalarial, ${ }^{6}$ anti-inflammatory, ${ }^{7}$ and antioxidation ${ }^{8}$ activities. Many reviews on synthetic methods developed for the heterocycles and their biological activities published thus far suggest their great potential as leading compounds for developing medicines. ${ }^{9}$ Among the DP derivatives, tautomeric 2-arylDPs have been reported to display remarkable pharmacological properties (Fig. 1). In 2003, Bay 41-4109 was shown to exhibit highly potent anti-hepatitis B virus (HBV) replication activity in vitro and in vivo. ${ }^{10}$ As a Bay 41-4109 analog with good water solubility, 6-morpholinylmethyl DP hydrochloride salt was reported as a HBV capsid assembly inhibitor. ${ }^{11}$ In 2008, another tautomeric 2-aryl-DP was also developed as a Rho-associated

[^0]kinase isoform 1 (ROCK1) inhibitor, which may be a potential therapeutic agent for cardiovascular diseases. ${ }^{12}$ Recently 2-arylethenyl DP was reported as a potent heat shock protein 90 (Hsp90) C-terminal inhibitor, which may be a drug candidate for cancer therapeutics. ${ }^{13}$

The biologically important tautomeric 2 -aryl-DPs shown in Fig. 1 have four substituents at the $2-, 4-, 5-$, and 6 -positions. In general, these derivatives and related compounds were synthesized by three-component cyclocondensation reaction such as Biginelli reaction, ${ }^{9-12}$ or a transition-metal-catalyzed arylation reaction from 2-thioxo-DPs prepared in advance. ${ }^{13,14}$ Recently a one-pot synthetic method for tetrasubstituted 2-aryl-

Bay 41-4109

Fig. 1 Biologically active 2-aryl-DPs.

DPs from $\alpha$-azidocinnamates by irradiation of LED light and base-catalyzed isomerization was also reported. ${ }^{15}$ Development of synthetic methods to access tautomeric 2 -aryl-DPs with different substituent patterns expands their structural diversity, which impacts the DP-based drug discovery program. For example, a conventional cyclocondensation reaction of arylamidine with $\alpha, \beta$-unsaturated aldehydes gives simple 2 -aryl-DPs with fewer substituents. ${ }^{16}$ We previously reported the cycliza-tion-elimination sequential reactions of 1,3-diazabuta-1,3diene with electron-deficient olefins to give hitherto unavailable 4,6-unsubstituted 2-phenyl-DPs and related analogs. ${ }^{17}$ With our continuing interest in developing efficient methods of synthesizing DPs with fewer or more substituents, ${ }^{18}$ we have recently developed a general synthetic method for 6 -unsubstituted DPs (Scheme 1). The 2-oxo- and 2-thioxo-DPs were synthesized by an $\mathrm{AlCl}_{3}$-mediated Biginelli-type threecomponent cyclocondensation reaction involving urea, aldehyde, and aminoacrylate. ${ }^{19}$ The 2-thioxo-DPs were stepwise converted into hitherto unavailable 2-amino-DPs via $\mathrm{Sc}(\mathrm{OTf})_{3}{ }^{-}$ mediated nucleophilic substitution of 2-methylthio-DPs with amines. ${ }^{20}$ The proliferative effect of these 6 -unsubstituted 2-oxo, 2-thioxo-, and 2 -amino-DPs on the human promyelocytic leukemia cell line HL-60 was also accessed, which led to the discovery of a highly active 2-benzylamino-DP with $\mathrm{IC}_{50}$ of $<100 \mathrm{nM} .{ }^{20}$ In this study, we planned that 2-methylthio-DPs or 2-thioxo-DPs were used as precursors for the synthesis of hitherto unavailable 6 -unsubstituted 2 -aryl-DPs by a transition-metalcatalyzed 2 -arylation reaction, Liebeskind-Srogl-type crosscoupling reaction. ${ }^{21}$ As a result, we realized the Pd-catalyzed/ Cu-mediated 2 -arylation reaction of 1-Boc 2-methylthio-DPs with arylstannane reagents. ${ }^{22}$ The Boc group significantly increases reactivity of DPs. This protocol enables the synthesis of 6 -unsubstituted 2 -aryl-DPs using various substituents at the 2 - and 4 -positions; to the best of our knowledge, the general formula of the 2 -aryl-DPs has not been reported. Owing to our results, a series of 6 -unsubstituted 2 -oxo-, 2 -thioxo-, and 2 -amino-, and 2-aryl-DPs becomes available, which would impact DP-based biological and pharmacological studies.

## Results and discussion

Initial studies of 2-thioxo-DP 1 were carried out under reaction condition A reported by Kappe ${ }^{14 a}\left[\mathrm{Pd}_{\left(\mathrm{PPh}_{3}\right)_{4}}(3.0 \mathrm{~mol} \%), \mathrm{Cu}(\mathrm{I})-\right.$ thiophene-2-carboxylate (CuTC, 3.0 equiv.), $\mathrm{PhB}(\mathrm{OH})_{2} 2$ (1.5 equiv.) in THF at reflux for 18 h ] and condition $B$ reported by Suzenet ${ }^{14 c}\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}\right.$ ( $5.0 \mathrm{~mol} \%$ ), $\mathrm{CuBr} \cdot \mathrm{Me}_{2} \mathrm{~S}$ ( 2.2 equiv.), $\mathrm{PhSnBu}_{3} 3 \mathbf{a}$ ( 2.2 equiv.) in THF at reflux for 24 h$]$. These reactions gave 2-phenyl-DP 4a in moderate yields of $47 \%$ under condition A and $22 \%$ under condition B (Scheme 2).

To increase the yield of the 2-arylation product, DP 1 was converted into 2-methylthio-DP 5 because the methylthio group is a typical substrate for the Liebeskind-Srogl reaction (Scheme 3). ${ }^{21}$ Our previous studies on the substitution reaction of DPs showed that a Boc group increased the electrophilicity of DPs. ${ }^{23}$ Therefore, 1-Boc 2-methylthio DP 6 a was prepared by incorporating the Boc group into 5 . The reaction occurred preferentially at the 1-position of 5 to give $\mathbf{6 a}$ in $\mathbf{7 9 \%}$ yield. The position of the Boc group of 6a was determined; as for 1-Boc 2-phenyl DP 7a shown in Table 1, a significant heteronuclear multiple bond correlation (HMBC) was observed between the 6-proton and the carbonyl carbon of the Boc group at the 1-position. Therefore, the Boc groups of 7a and 6a were determined to be located at the 1-position. To determine a suitable substrate for the crosscoupling reaction, the reactivity of $\mathbf{6 a}$ was examined and compared with those of $\mathbf{1}$ and 5 .

Scheme 2 Reactions of 2-thioxo-DP 1 under reported reaction conditions.

Scheme 1 Synthesis of a series of 6-unsubstituted DPs.

Scheme 3 Preparation of DP 5 and 6a from 1.

The optimized reaction conditions for $\mathbf{6 a}$ are summarized in Table 1. The effect of two Cu sources was examined under the same reaction condition, and results showed that CuTC worked better than $\mathrm{CuBr} \cdot \mathrm{Me}_{2} \mathrm{~S}$ to give a combined yield of $65 \%$ for a desired 2-phenyl-DP 7a and 4a (entries 1 and 2). In all reactions using 3 in this study, the DPs $7 \mathbf{7 a}$ and $4 \mathbf{4}$ were purified by
column chromatography using silica gel- $\mathrm{K}_{2} \mathrm{CO}_{3}(10: 1)$ to prevent mixing with degradation product from $3 .{ }^{24}$ Among the Pd catalysts tested, tris(dibenzylideneacetone)dipalladium $\left(\mathrm{Pd}_{2} \mathrm{dba}_{3}\right)$ with (2-furyl) ${ }_{3} \mathrm{P}$ used in the reaction gave a good combined yield of $80 \%$ for 7 a and $\mathbf{4 a}$ (entries 1, 3-5). As an arylation reagent, $\mathrm{PhSnBu}_{3}$ 3a showed a higher reactivity than $\mathrm{PhB}(\mathrm{OH})_{2} 2$ (entries 5 and 6). Subsequently, the effect of phosphine ligands was examined; only a few monodentate ligands, such as $(2 \text {-furyl })_{3} \mathrm{P}$, (2-thienyl) ${ }_{3} \mathrm{P}$, and triphenylphosphine $\left(\mathrm{Ph}_{3} \mathrm{P}\right)$, increased the yields compared with the reaction without phosphine (entries 5, 7-9). The reactions using other monodentate ligands such as $\left(2-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right)_{3} \mathrm{P}$ and $\left(\text { cyclo }-\mathrm{C}_{6} \mathrm{H}_{11}\right)_{3} \mathrm{P}$ resulted in low yields (entries 10 and 11). All bidentate ligands including 1,1-bis(diphenylphophino)methane (dppm), 1,2-bis(diphenylphophino)ethane (dppe), 1,3-bis(diphenylphophino)

[^1]propane (dppp), 1,1-bis(diphenylphophino)butane (dppb), 1,1'bis(diphenylphophino)ferrocene (dppf), and racemic BINAP (rac-BINAP) gave low yields (entries 12-17). As a result, the best ligand was determined to be (2-furyl) ${ }_{3} \mathrm{P}$ (entry 5 ). We confirmed that either reaction in the absence of $\mathrm{Pd}_{2} \mathrm{dba}_{3} /(2 \text {-furyl })_{3} \mathrm{P}$ or CuTC hardly proceeded with the recovery of only $\mathbf{6 a}$ (entries 18 and 19); therefore, the addition of these reagents was essential for the reaction. To examine the effect of solvents, several polar and nonpolar solvents, such as dioxane (1,4-dioxane), DMF, toluene, 1,2-DCE (1,2-dichloroethane), and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, were used (entries 20-24). Although a small effect on the yields was observed, the reaction in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ showed a superior result and good mass balance to give a combined yield of $81 \%$ for 7 a and 4 a with $18 \%$ recovery of $\mathbf{6 a}$ (entry 24 ). When the reaction was conducted for a longer time of 30 h , the combined yield of $7 \mathbf{a}$ and 4a was increased to $93 \%$ (entry 25). When the optimized reaction condition was applied to the reactions using 1 or 5 as a substrate, the desired 4 a was obtained in lower yields of $24 \%$ and $55 \%$, respectively (entries 26 and 27 ). Therefore, the best substrate among $\mathbf{1}, \mathbf{5}$, and $\mathbf{6 a}$ for the reaction was determined to be $\mathbf{6 a}$. The Boc group in $\mathbf{6 a}$ had a significant effect on the reactivity of $\mathbf{6 a}$ probably owing to its high electrophilicity being further increased by the group. When lower amount of $\mathrm{Pd}_{2} \mathrm{dba}_{3}$ ( $1 \mathrm{~mol} \%$ ) and ( 2 -furyl) $)_{3} \mathrm{P}(8 \mathrm{~mol} \%)$ were used, the combined yield slightly decreased to $82 \%$ (entry 28 ).

With the optimized condition in hand, we examined the scope of the Pd -catalyzed/Cu-mediated reaction using diverse aryl tributylstannanes 3 and DP derivatives 6 (Scheme 4). Regarding 3, we found no clear preference for either electron-donating or electron-withdrawing substituents of the phenyl group. When 6a ( $\mathrm{R}=\mathrm{Ph}$ ) was reacted with $p$-methoxyphenyl- or $p$-tolyl tributylstannanes, the desired DPs $7 \mathbf{b}$ and $7 \mathbf{c}$ were produced in high yields of $98 \%$ and $95 \%$, respectively. Aryl tributylstannanes having other substituents such as $\mathrm{Ph}, \mathrm{CF}_{3}, \mathrm{CO}_{2} \mathrm{Me}$, and $\mathrm{NO}_{2}$ groups at the para position smoothly afforded to give the products $\mathbf{7 d} \mathbf{d} \mathbf{- 7}$ in $84-88 \%$ yields. The reactions using $m$-nitrophenyl or 3,5-bis(trifluoromethyl)phenyl tributylstannanes also proceeded smoothly to afford the products $7 \mathbf{h}$ and $\mathbf{7 i}$ in $86 \%$ and $89 \%$ yields, respectively. Various heteroaryl tributylstannanes having 2-thienyl, 3-thienyl, 2-pyridinyl, and 3-pyridinyl groups also reacted with $\mathbf{6 a}$ to give $\mathbf{7 j} \mathbf{- 7 m}$, albeit with low yields of $31-$ $33 \%$ in the case of pyridine. We next examined the reaction scope for 6 using different substituents at the 4-position. We prepared seven 4 -aryl-DPs 6a- $\mathbf{6 g}$ having substituents such as $\mathrm{H}, \mathrm{OMe}, \mathrm{Me}$, $\mathrm{Br}, \mathrm{Cl}$, and $\mathrm{CF}_{3}$ groups at the para position and Cl group at the ortho position. 4-n-Propyl-DP 6h and 4-cyclohexyl-DP $6 \mathbf{i}$ were also prepared. The synthetic procedure and the characteristic data of these DPs 6a-6i were shown in the experimental section. Regarding the aryl group of $\mathbf{6}$ at the 4 -position, the reactions of DPs bearing substituents at the para position, proceeded smoothly to give the desired products $7 \mathbf{n}-7 \mathbf{r}$ in $84-98 \%$ yields. The reaction of the DP with the ortho-chlorophenyl group at the 4position gave a DP 7s in $87 \%$ yield. Alkyl substituents such as $n$ propyl and cyclohexyl groups were also tolerated in the reaction to afford $7 \mathbf{t}$ and $\mathbf{7 u}$ in good yields.

The Pd-catalyzed/Cu-mediated reaction was applied to 4,4,6trisubstituted 2-methylthio-DP 8 (Scheme 5). ${ }^{18 a}$ An attempt to

Reaction conditions: 6 ( 0.25 mmol$), 3$ ( $0.50 \mathrm{mmol}, 2.0$ equiv.), $\mathrm{Pd}_{2} \mathrm{dba}_{3}$ ( $2.5 \mathrm{~mol} \%$ ), ( 2 -furyl) $)_{3} \mathrm{P}(20 \mathrm{~mol} \%)$, CuTC ( $0.50 \mathrm{mmol}, 2.0$ equiv.), and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \mathrm{~mL})$ at reflux for 30 h under Ar. ${ }^{a} 3$ ( 4.0 equiv.), $\mathrm{Pd}_{2} \mathrm{dba}_{3}$ ( $5.0 \mathrm{~mol} \%$ ), ( 2 -furyl $)_{3} \mathrm{P}(40 \mathrm{~mol} \%)$, CuTC ( 4.0 equiv.) were used.
incorporate a Boc group to N -unsubstituted 8 using $\mathrm{NaH} / \mathrm{Boc}_{2} \mathrm{O}$ failed owing to the steric congestion around the nitrogen atom. However, the reaction of 8 under the optimized conditions in Table 1 proceeded smoothly to give $2,4,4,5,6$-pentasubstituted

Scheme 5 Synthesis of 2,4,4,5,6-pentasubstituted DP 9.

DP 9 in 71\% yield. Such fully substituted 2-aryl-DP 9 has not been found in literature. Further optimization of the reaction condition for the synthesis of related pentasubstituted DPs is in progress.

The Boc group of 7 was removed under a standard acidic condition (TFA in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) to produce $N$-unsubstituted 1,4-DP 10 and $1,6-\mathrm{DP} 11$ as a mixture of the tautomers (Scheme 6). To analyze the tautomeric behavior of 10 and 11, ${ }^{1} \mathrm{H}$ NMR spectra of a mixture of $\mathbf{1 0 a} / \mathbf{1 1 a}, \mathbf{1 0 b} / 11 \mathrm{~b}$, and $10 \mathrm{~g} / 11 \mathrm{~g}$ were measured in $\mathrm{CD}_{3} \mathrm{OD}$ and DMSO- $d_{6}$, respectively ( $0.01 \mathrm{M}, 25^{\circ} \mathrm{C}$ ). In $\mathrm{CD}_{3} \mathrm{OD}$, only average spectra of $\mathbf{1 0} / \mathbf{1 1}$ were observed because of the relatively fast tautomerization in the protic solvent. On the other hand, two individual tautomers of $\mathbf{1 0} / \mathbf{1 1}$ were observed in the ratio of $1.0: 1.0-2.5: 1.0$ in DMSO- $d_{6}$. The ratio of $\mathbf{1 0} / \mathbf{1 1}$ in DMSO- $d_{6}$ was affected by substituents at the para position of the 2-phenyl group; the ratios were $1.0: 1.0$ for $\mathbf{1 0 b} / \mathbf{1 1 b}(\mathrm{R}=\mathrm{OMe}), 1.6: 1.0$ for $10 \mathrm{a} /$ 11a $(\mathrm{R}=\mathrm{H})$, and $2.5: 1.0$ for $\mathbf{1 0 g} / \mathbf{1 1 g}\left(\mathrm{R}=\mathrm{NO}_{2}\right)$. These results indicate that the electron-donating property of the MeO group stabilized 1,6-DP 11b and increased the ratio of 11b owing to the resonance effect from the MeO group to the carbonyl group at the 5-position. In contrast, the electron-withdrawing property of the $\mathrm{NO}_{2}$ group weakens the effect and destabilizes 1,6-DP 11g. The thermodynamic preference of 1,4 -DPs such as $\mathbf{1 0 a}$ and 10 g over 11a and 11 g was supported by our previous experimental and theoretical studies on 2 -substituted DP tautomers. ${ }^{25}$

In summary, we have developed a Pd-catalyzed/Cu-mediated cross-coupling reaction for the synthesis of 6 -unsubstituted 2 -aryl-DPs 7 from 1-Boc 2-methylthio-DP 6. The incorporation of the Boc group at the nitrogen atom of 6 significantly increased the reactivity of 6 . The method is compatible with diverse DP substrates and aryl tributylstannane reagents. The method is also applicable to the reaction using 8 for the synthesis of highly pentasubstituted 2-aryl-DP 9. The Boc group of 7 was removed quantitatively to obtain a tautomeric mixture of $\mathbf{1 0} / \mathbf{1 1}$. The synthetic procedure should help expand the DP-based molecular diversity, which would impact biological and pharmacological studies.

## Experimental section

## General information

Melting points were determined with an AS ONE melting point apparatus ATM-02 (AS ONE Corporation, Japan) or Yanaco

Scheme 6 Synthesis and analysis of 2-aryl-DP tautomers.
melting point apparatus MP-J3 without correction. ${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Bruker AVANCE ${ }^{\mathrm{TM}} \mathrm{III} 600(600 \mathrm{MHz}$, Bruker Japan K.K., Japan) or JEOL JNM-ECZ500R ( 500 MHz , JEOL Ltd., Japan) with tetramethylsilane ( $\delta 0 \mathrm{ppm}$ ) in $\mathrm{CDCl}_{3}$ or dimethylsulfoxide ( $\delta 2.49 \mathrm{ppm}$ ) in DMSO- $d_{6}$, or methanol ( $\delta 3.30$ $\mathrm{ppm})$ in $\mathrm{CD}_{3} \mathrm{OD}$ as internal standards. ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker AVANCE ${ }^{\text {TM }}$ III 600 ( 150 MHz ) or JEOL JNM-ECZ500R ( 125 MHz ) with chloroform ( $\delta 77.0 \mathrm{ppm}$ ) in $\mathrm{CDCl}_{3}$ or dimethylsulfoxide ( $\delta 39.7 \mathrm{ppm}$ ) in DMSO- $d_{6}$ or methanol ( $\delta 49.0 \mathrm{ppm}$ ) in $\mathrm{CD}_{3} \mathrm{OD}$ as internal standards. Multiplicities for ${ }^{1} \mathrm{H}$ NMR were designated as $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{dd}=$ doublet of doublets, $\mathrm{dt}=$ doublet of triplets, $\mathrm{dq}=$ doublet of quartets, $\mathrm{tt}=$ triplet of triplets, $\mathrm{ddd}=$ doublet of doublets of doublets, $\mathrm{m}=$ multiplet, and $\mathrm{br}=$ broad. Infrared spectra (IR) were measured on a JASCO FT/IR-6100 or JASCO FT/IR-4100 Fourier transform infrared spectrophotometer (JASCO Corporation, Japan). Mass spectra were recorded on a JEOL JMS-700 mass analyzer (JEOL Ltd., Japan). Highresolution spectroscopy (HRMS) was performed using a JEOL JMS-700 mass analyzer.

## Synthesis of starting materials 6

Following the literature procedure, ${ }^{19}$ 1-tert-butyl 5-ethyl 2-methylthio-4-phenyl-1,4-dihydropyrimidine-1,5-dicarboxylate (6a), ${ }^{19}$ 1-tert-butyl 5-ethyl 4-(4-methoxyphenyl)-2-methylthio-1,4-dihydropyrimidine-1,5-dicarboxylate (6b), 1-tert-butyl 5-ethyl 4-(4-methylphenyl)-2-methylthio-1,4-dihydropyrimidine-1,5-
dicarboxylate ( $\mathbf{6 c}$ ), 1-tert-butyl 5-ethyl 4-(4-bromophenyl)-2-methylthio-1,4-dihydropyrimidine-1,5-dicarboxylate (6d), 1-tert-butyl $\quad 5$-ethyl 4 -(4-chlorophenyl)-2-methylthio-1,4-dihydropyrimidine-1,5-dicarboxylate (6e), 1-tert-butyl 5-ethyl 4-[4-(trifluoromethyl)phenyl]-2-methylthio-1,4-
dihydropyrimidine-1,5-dicarboxylate (6f), 1-tert-butyl 5-ethyl 4-(2-chlorophenyl)-2-methylthio-1,4-dihydropyrimidine-1,5dicarboxylate ( $\mathbf{6 g}$ ), 1-tert-butyl 5-ethyl 2-methylthio-4-propyl-1,4-dihydropyrimidine-1,5(4H)-dicarboxylate (6h), ${ }^{19}$ 1-tert-butyl 5ethyl $\quad 4$-cyclohexyl-2-methylthio-1,4-dihydropyrimidine-1,5dicarboxylate ( $\mathbf{6 i}$ ) were prepared.

1-tert-Butyl 5-ethyl 4-(4-methoxyphenyl)-2-methylthio-1,4-dihydropyrimidine-1,5-dicarboxylate (6b). Pale yellow oil. ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CDCl}_{3}, 600 \mathrm{MHz}\right): \delta=1.23(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 1.59(\mathrm{~s}, 9 \mathrm{H})$, $2.28(\mathrm{~s}, 3 \mathrm{H}), 3.78(\mathrm{~s}, 3 \mathrm{H}), 4.14(\mathrm{dq}, J=10.8,7.2 \mathrm{~Hz}, 1 \mathrm{H}), 4.17(\mathrm{dq}$, $J=10.8,7.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.67(\mathrm{~s}, 1 \mathrm{H}), 6.84(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.22$ (d, $J=8.4 \mathrm{~Hz}, 2 \mathrm{H}), 7.93(\mathrm{~s}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 150 \mathrm{MHz}\right): \delta=$ 14.1, 15.9, 28.0, 55.2, 58.3, 60.5, 85.7, 111.9, 113.8, 128.3, 132.3, 134.7, 148.4, 149.2, 158.9, 165.3. ## General procedure for synthesis of 2-aryl-DPs 7 and 9

1-tert-Butyl 5-ethyl 2,4-diphenyl-1,4-dihydropyrimidine-1,5dicarboxylate (7a). Under an atmosphere of Ar, a mixture of $\mathbf{6 a}$ ( $94.0 \mathrm{mg}, 0.250 \mathrm{mmol}, 1.0$ equiv.), phenyltributylstannane 2 a ( $184 \mathrm{mg}, \quad 0.501 \mathrm{mmol}, 2.0$ equiv.), $\mathrm{Pd}_{2} \mathrm{dba}_{3}(5.8 \mathrm{mg}$, $0.00633 \mathrm{mmol}, 0.025$ equiv.), ( 2 -furyl $)_{3} \mathrm{P}(11.6 \mathrm{mg}, 0.0500 \mathrm{mmol}$, 0.20 equiv.), and CuTC ( $96 \mathrm{mg}, 0.503 \mathrm{mmol}, 2.0$ equiv.) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3.0 \mathrm{~mL})$ was heated at reflux for 30 h . The mixture was filtered through a Celite pad and washed with EtOAc ( 20 mL ). The filtrate was washed with aqueous 1 M NaOH solution (10 mL ), and the organic layer was separated. The aqueous layer was extracted with EtOAc $(10 \mathrm{~mL})$. The combined organic layers were washed with water ( 5 mL ) and brine ( 5 mL ), dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under reduced pressure. The residue was purified by flash column chromatography (silica gel- $\mathrm{K}_{2} \mathrm{CO}_{3}, 10: 1$; $^{24}$ eluent: $n$-hexane-EtOAc, $11: 1$ to $6: 1$ ) to give $7 \mathrm{a}(93.0 \mathrm{mg}, 0.229 \mathrm{mmol}, 91 \%)$ as colorless crystals. Mp 139-141 ${ }^{\circ} \mathrm{C}$ ( $n$-hexane-EtOAc). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 600 \mathrm{MHz}\right)$ : $\delta=1.18(\mathrm{~s}, 9 \mathrm{H}), 1.28(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}), 4.20(\mathrm{dq}, J=10.8,7.2 \mathrm{~Hz}$, $1 \mathrm{H}), 4.24(\mathrm{dq}, J=10.8,7.2 \mathrm{~Hz}, 1 \mathrm{H}), 5.94(\mathrm{~s}, 1 \mathrm{H}), 7.28(\mathrm{t}, J=$ $7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.32-7.44(\mathrm{~m}, 7 \mathrm{H}), 7.47(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 2 \mathrm{H}), 8.13(\mathrm{~d}, J$ $=1.2 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 150 \mathrm{MHz}\right): \delta=14.2,27.3,58.7$, 60.7, 84.6, 114.2, 127.0, 127.2, 127.5, 128.1, 128.7, 129.7, 133.6, 136.7, 141.0, 149.5, 151.3, 165.0. ## General procedure for synthesis of tautomeric 2-aryl-DPs 10

 and 11Ethyl 2,4-diphenyl-1,4-dihydropyrimidine-5-carboxylate (10a) and ethyl 2,6-diphenyl-1,6-dihydropyrimidine-5carboxylate (11a). To a solution of $7 \mathbf{7 a}(334 \mathrm{mg}, 0.822 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(8.0 \mathrm{~mL})$ was added trifluoroacetic acid $(2.50 \mathrm{~mL}, 32.7$ mmol ) at $0{ }^{\circ} \mathrm{C}$. The reaction mixture was stirred at room temperature for 3 h , and 2 M NaOH aqueous solution ( 20 mL ) and EtOAc ( 20 mL ) were added. The organic layer was separated, and the aqueous layer was extracted with EtOAc ( 20 mL ). The combined organic layers were washed with water ( 5 mL ), brine ( 5 mL ), dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered, and concentrated under reduced pressure. The residue was purified by flash column chromatography (silica gel; eluent: $n$-hexane-EtOAc- $\mathrm{Et}_{3} \mathrm{~N}$, 150: $60: 1$ to $100: 100: 1$ ) to give a tautomeric mixture of 10a and 11a ( $249 \mathrm{mg}, 0.813 \mathrm{mmol}, 99 \%$ ) as yellow crystals. Mp 152-153 ${ }^{\circ} \mathrm{C}$ ( $n$-hexane-EtOAc). ${ }^{1} \mathrm{H}$ NMR of the mixture of tautomers, 10a : 11a $=1.6: 1\left(\mathrm{DMSO}-d_{6}, 500 \mathrm{MHz}\right): \delta=1.147(10 \mathrm{a}, \mathrm{t}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H})$, $1.152(11 \mathrm{a}, \mathrm{t}, J=7.0 \mathrm{~Hz}, 3 \mathrm{H}), 3.98-4.12$ (10a, m, 2H + 11a, m, 2H), 5.45 (11a, d, $J=3.5 \mathrm{~Hz}, 1 \mathrm{H}), 5.57$ (10a, s, 1H), 7.16-7.56 (10a, m, $8 \mathrm{H}+11 \mathrm{a}, \mathrm{m}, 8 \mathrm{H}), 7.38(10 \mathrm{a}, \mathrm{d}, J=5.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.66(11 \mathrm{a}, \mathrm{s}, 1 \mathrm{H})$, $7.80(10 \mathrm{a}, \mathrm{d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.88(11 \mathrm{a}, \mathrm{d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}), 9.28(11 \mathrm{a}$, $\mathrm{d}, J=3.5 \mathrm{~Hz}, 1 \mathrm{H}), 9.88(\mathbf{1 0 a}, \mathrm{~d}, J=5.5 \mathrm{~Hz}, 1 \mathrm{H}) .{ }^{1} \mathrm{H}$ NMR, average spectrum of the tautomers $\left(\mathrm{CD}_{3} \mathrm{OD}, 500 \mathrm{MHz}\right): \delta=1.21(\mathrm{t}, J=$ $7.0 \mathrm{~Hz}, 3 \mathrm{H}), 4.10(\mathrm{dq}, J=10.5,7.0 \mathrm{~Hz}, 1 \mathrm{H}), 4.13(\mathrm{dq}, J=10.5$, $7.0 \mathrm{~Hz}, 1 \mathrm{H}), 5.58(\mathrm{~s}, 1 \mathrm{H}), 7.25(\mathrm{t}, J=7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.33(\mathrm{t}, J=7.5 \mathrm{~Hz}$, $2 \mathrm{H}), 7.39(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.45(\mathrm{t}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}), 7.53(\mathrm{t}, J=$ $7.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.58(\mathrm{~s}, 1 \mathrm{H}), 7.69(\mathrm{~d}, J=7.5 \mathrm{~Hz}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR, average spectrum of the tautomers $\left(\mathrm{CD}_{3} \mathrm{OD}, 125 \mathrm{MHz}\right): \delta=14.6,56.6,61.3$, 107.5 (br), 128.1, 128.3, 128.8, 129.6, 129.8, 132.5, 135.0, 140.7 (br), 146.2, 156.8 (br), 168.0.
