Received 23 January 2011; accepted 19 February 2011

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; disorder in main residue; R factor = 0.070; wR factor = 0.185; data-to-parameter ratio = 17.0.

The asymmetric unit of the title compound, $C_{47}H_{58}N_6O_6$, comprises three independent molecules, in one of which one *tert*-butyl group is disordered in a 1:1 ratio. The molecule is a di(aryl)methane having two aliphatic and one *N*-heterocyclic substituent in each aryl ring. For the molecule having the disordered *tert*-butyl group, the aryl rings make an angle of $115.3(2)^\circ$ at the methylene carbon; one aryl ring is aligned at $42.0(1)^\circ$ with respect to the *N*-heterocyclic substituent and the other at $48.7(1)^\circ$ with respect to its substituent. The two ordered molecules are disposed about a pseudo center of inversion. The pairs of twist angles in these two molecules differ [$52.7(1)$ and $61.7(1)^\circ$, and $29.1(1)$ and $58.5(1)^\circ$].

Comment

Some background on di(aryl)methane compounds having oxyacetate substituents was presented in an earlier report (Ali *et al.*, 2011). The title compound also has an N-heterocyclic substituent in the rings (Scheme I). The asymmetric unit of C₄₇H₅₈N₆O₆ consists of three molecules (Figs. 1 to 3), one of which is disordered in one *tert*-butyl group in a 1:1 ratio. For the molecule having the disordered *tert*-butyl group, the aryl rings make an angle of 115.3 (2)° at the methylene carbon with one aryl ring aligned at 42.0 (1)° with respect to the N-heterocyclic substituent and the other at 48.7 (1)° with respect to its substituent. The two ordered molecules are disposed about a false center-of-inversion with the pairs of twist angles in the other two molecules different [52.7 (1) and 61.7 (1)°; 29.1 (1) and 58.5 (1)°].

Experimental

6,6'-Methylenebis(2-(2H-benzo[d][1,2,3]triazol-2-yl)-4-(2,4,4-trimethylpentan-2-yl)phenol) (0.10 g) and potassium carbonate (0.05 g) were dissolved in acetone (20 ml) at 323 K. Chloromethyl acetate (0.04 ml) was added and the reaction was stirred for 20 h. The progress of the reaction was monitored by thin layer chromatography (hexane:dichloromethane 60:40). The reaction was quenched by adding 1 M hydrochloric acid (10 ml). The aqueous phase was extracted with dichloromethane, the solvent evaporated and the crude product was recrystallized from dichloromethane (yield 80%).

Refinement

Carbon-bound H-atoms were placed in calculated positions [C—H 0.95 to 0.98 Å, $U_{\text{iso}}(\text{H}) = 1.2$ to $1.5U_{\text{eq}}(\text{C})$] and were included in the refinement in the riding model approximation. One of the *tert*-butyl groups of one of the three independent molecules is disordered over two positions; the disorder could not be refined, and was assumed to be a 1:1 type of disorder. The C—C_{methyl} bond distance was restrained to 1.50 ± 0.01 and the C···C_{methyl} distance to 2.35 ± 0.01 Å. The displacement parameters of the primed atoms were set to those of the unprimed ones, and the anisotropic displacement parameters were restrained to be nearly isotropic. The anisotropic displacement parameters of the O12 atom were similarly restrained as the ellipsoid was too elongated. The final difference Fourier map had a large peak 0.34 Å from H21F and a hole 0.23 Å from C23'. One of the H-atoms of C23' (*i.e.*, H23E) is close to an ordered H18B atom at a distance of 1.78 Å; the interaction is probably an artifact of the disorder. The 'huge' version of *SHELXL97* was used for refining the structure.
