Received 18 June 2009; accepted 24 June 2009

Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002 \text{ \AA}$ ;  $R$  factor = 0.029;  $wR$  factor = 0.079; data-to-parameter ratio = 21.3.

The asymmetric unit of the title compound,  $C_{24}H_{20}N_2S_4$ , contains one half-molecule: a crystallographic centre of inversion is located at the mid-point of the two central C atoms. The thiophene ring is oriented at a dihedral angle of  $60.64(3)^\circ$  with respect to the benzene ring. In the crystal structure,  $\pi-\pi$  contacts between thiophene rings [centroid-centroid distance =  $3.581(1) \text{ \AA}$ ] may stabilize the structure. A weak C–H $\cdots$  $\pi$  interaction is also present.

## N-(2-Thienylmethylene)-2-{[2-(2-thienylmethylenamino)phenyl]sulfanyl}ethylsulfanyl)aniline

A. Kakanejadifard and V. Amani

### Comment

There are several examples of  $\text{N}_2\text{S}_2$  Schiff bases type of adducts which exist as anti configuration. For 2-[2-(2-aminophenylthio)benzeneamine] adduct see: (Gok & Demirbas, 1989; Dharaa *et al.*, 2005; Kakanejadifard *et al.*, 2007; Kakanejadifard & Amani, 2008). For  $\text{N}_2\text{S}_2$  Schiff bases adduct see: (Rajsekhar *et al.*, 2002; Taylor *et al.*, 2008; Morshedi *et al.*, 2009). For  $\text{N}_2\text{O}_2\text{S}_2$  Schiff bases adduct see: (Rajsekhar *et al.*, 2004). We report herein the synthesis and crystal structure of the title compound.

The asymmetric unit of the title compound, (Fig. 1), contains one-half molecule. A crystallographic centre of inversion is located at the midpoint between the two central C atoms. The bond lengths (Allen *et al.*, 1987) and angles are within normal ranges. Rings A (C2-C7) and B (S2/C9-C12) are, of course, planar and they are oriented at a dihedral angle of 60.64 (3) $^{\circ}$ .

In the crystal structure, the  $\pi$ - $\pi$  contact between the thiophene rings,  $\text{Cg2—Cg2}^{\text{i}}$ , [symmetry code: (i) -x, -y, 1 - z, where  $\text{Cg2}$  is centroid of the ring B (S2/C9-C12)] may stabilize the structure, with centroid-centroid distance of 3.581 (1) Å. There also exists a weak C—H $\cdots$  $\pi$  interaction (Table 1).

### Experimental

For the preparation of the title compound, a solution of thiophencarbaldehyde (20 mmol) was added dropwise to a solution of 2-[2-(2-aminophenylthio)benzeneamine] (2.76 g, 10 mmol) in absolute ethanol (25 ml) with stirring in 10 min at room temperature. The mixture was stirred and heated to reflux for 5 h. The product was filtered and crystallized from  $\text{CH}_3\text{CN}$  (yield; 45%, m.p. 398–399 K).

### Refinement

H atoms were positioned geometrically with C—H = 0.95 and 0.99 Å for aromatic and methylene H atoms, respectively, and constrained to ride on their parent atoms, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

### Figures

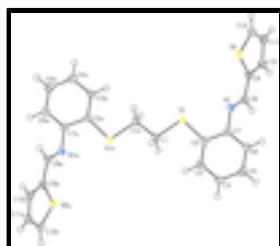

Fig. 1. The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level [symmetry code: (a) 1 - x, -y, 2 - z].

$M_r = 464.66$	$D_x = 1.417 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
Hall symbol: -P 2ybc	Cell parameters from 887 reflections
$a = 11.179 (5) \text{ \AA}$	$\theta = 3\text{--}30^\circ$
$b = 7.730 (4) \text{ \AA}$	$\mu = 0.45 \text{ mm}^{-1}$
$c = 12.608 (6) \text{ \AA}$	$T = 100 \text{ K}$
$\beta = 91.899 (12)^\circ$	Prism, yellow
$V = 1088.9 (9) \text{ \AA}^3$	$0.30 \times 0.20 \times 0.15 \text{ mm}$
$Z = 2$	

### Data collection

Bruker Kappa APEXII CCD diffractometer	2899 independent reflections
Radiation source: fine-focus sealed tube	2569 reflections with $I > 2/s(I)$
Monochromator: graphite	$R_{\text{int}} = 0.029$
$T = 100 \text{ K}$	$\theta_{\max} = 29.0^\circ$
$\varphi$ and $\omega$ scans	$\theta_{\min} = 1.8^\circ$
Absorption correction: multi-scan (SADABS; Bruker, 2005)	$h = -15 \rightarrow 15$
$T_{\min} = 0.895$ , $T_{\max} = 0.930$	$k = -10 \rightarrow 10$
12880 measured reflections	$l = -17 \rightarrow 17$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.029$	H-atom parameters constrained
$wR(F^2) = 0.079$	$w = 1/[\sigma^2(F_o^2) + (0.0441P)^2 + 0.43P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.00$	$(\Delta/\sigma)_{\max} = 0.001$
2899 reflections	$\Delta\rho_{\max} = 0.34 \text{ e \AA}^{-3}$
136 parameters	$\Delta\rho_{\min} = -0.26 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

## Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
