Received 22 September 2011; accepted 1 November 2011

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.010\text{ \AA}$; R factor = 0.038; wR factor = 0.074; data-to-parameter ratio = 11.5.

The title compound, $[\text{Cu}(\text{C}_{12}\text{H}_8\text{N}_2)(\text{C}_{27}\text{H}_{26}\text{P}_2)]\text{ClO}_4$, crystallizes with two Cu^I complex cations and two perchlorate anions in the asymmetric unit. Each Cu^I cation is four-coordinated by two P atoms of a 1,3-bis(diphenylphosphanyl)propane molecule and two N atoms of a 1,10-phenanthroline ligand, with a coordination geometry that can be considered as distorted tetrahedral. The crystal studied was twinned with a twin ratio of 0.786 (2):0.214 (2).

Related literature

For related structures, see: Abakumov *et al.* (1998); Saito *et al.* (2006); Fournier *et al.* (2004); Affandi *et al.* (1997); Jin *et al.* (2009); Alanidis *et al.* (2002). Potential twinning was indicated by PLATON (Spek, 2009) and confirmed using ROTAX (Parson & Gould, 2001) as included in the WinGX suite (Farrugia, 1999).

[1,3-Bis(diphenylphosphanyl)propane- κ^2P,P'](1,10-phenanthroline- κ^2N,N')copper(I) perchlorate

Y.-L. Xiao, L.-L. Zhou, S. Gao, Q.-H. Jin and C.-L. Zhang

Comment

There has been an increasing interest in the photophysics and photochemistry of Cu^I complexes in the last few decades. Especially Cu^I complexes of mixed ligand phosphines and 1,10-phenanthroline (phen) have been often used as interesting emitters. Among the diphosphine ligands known in the literature, 1,3-Bis(diphenylphosphanyl) propane (dppp) is extensively studied since dppp is a very efficient bidentate ligand to lock one metal atom (Abakumov *et al.*, 1998; Saito *et al.*, 2006; Fournier *et al.*, 2004; Affandi *et al.*, 1997). As a part of the extension of our study on photophysical properties of copper(I) complexes with ligands containing phosphine and nitrogen atoms (Jin *et al.*, 2009), we synthesized a new complex with the formula [Cu(dppp)(phen)]⁺(ClO₄)⁻.

The bond distances, bond and torsion angles in the two Cu^I complex moieties present in the asymmetric units are quite similar, in fact the two molecules can be almost perfectly overlayed, *Mercury* (Macrae *et al.*, 2008). Each copper(I) cation is four-coordinated by two phosphorus atoms from dppp, and two nitrogen atoms from phen. The angles P—Cu—P, N—P—N and P—Cu—N are in the range of 104.71 (12)[°]-105.03 (12)[°], 81.0 (4)[°]-81.2 (4) and 108.7 (3)[°]-124.1 (3)[°], respectively, which confirms the distorted tetrahedral environment around both of the copper(I) cations (Fig. 1).

Experimental

A mixture of Cu(ClO₄)₂(55.58 mg, 0.15 mmol) and Cu (9.53 mg, 0.15 mmol) were stirred in a solution of CH₃CN(15 ml) and CH₂Cl₂(5 ml), after half one hour the blue solution became colorless, and then 1,10-phen (39.6 mg, 0.3 mmol) and dppp (123.73 mg, 0.3 mmol) were added and the solution stirred for 3 h. The yellow filtrate was allowed to stand at room temperature for several days and yellow crystal of the title complex [Cu(dppp)(phen)](ClO₄) were obtained. Crystals suitable for single-crystal X-ray diffraction were selected directly from the sample as prepared.

Refinement

Metal atom were located from the E-maps and other non-hydrogen atoms were located in successive difference Fourier syntheses. H atoms were geometrically positioned and refined in the riding model approximation, with C—H = 0.93 and 0.97 Å for aromatic and methylene respectively and U_{iso}(H)=1.2U_{eq}(C).

Potential twinning was indicated by *PLATON* (Spek, 2009) and confirmed using *ROTAX* program (Parson & Gould, 2001) as included in the *WINGX* suite (Farrugia, 1999). Refinements were done using the twining matrix [-1 0 0, 0 -1 0, 0 0 1], which gave a twin ratio of 0.786:0.214 (2).

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
