Correspondence e-mail: rosesunqz@yahoo.com.cn

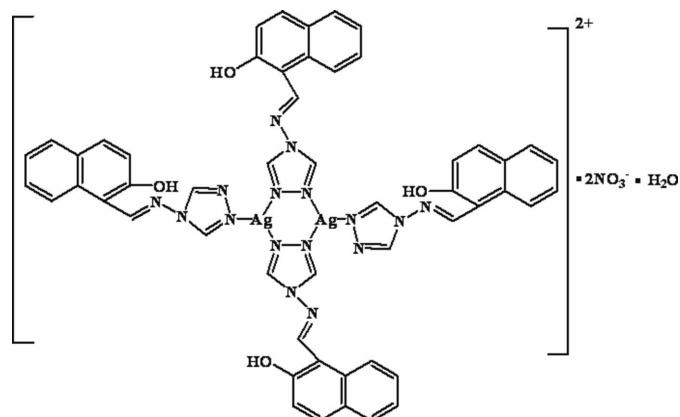

Received 1 November 2008; accepted 10 February 2009

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.008\text{ \AA}$ ; disorder in solvent or counterion;  $R$  factor = 0.055;  $wR$  factor = 0.133; data-to-parameter ratio = 12.0.

The new ligand 1-(1,2,4-triazol-4-yliminomethyl)-2-naphthol ( $L$ ) and the title silver(I) complex, namely bis[ $\mu$ -1-(1,2,4-triazol-4-yliminomethyl)-2-naphthol]bis[[1-(1,2,4-triazol-4-yliminomethyl)-2-naphthol]silver(I)] dinitrate monohydrate,  $[\text{Ag}_2(\text{C}_{13}\text{H}_{10}\text{N}_4\text{O})_4](\text{NO}_3)_2\cdot\text{H}_2\text{O}$ , were synthesized. Each silver center in the dimeric complex (related by an inversion centre) is coordinated by two bridging  $L$  ligands and one additional  $L$  ligand in a monodentate fashion, exhibiting a distorted trigonal-planar coordination. The discrete dimers are further linked through  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds and weak  $\pi-\pi$  stacking interactions [the shortest atom–atom separation is *ca* 3.46 Å between the parallel stacking pairs]. Intramolecular  $\text{O}-\text{H}\cdots\text{N}$  hydrogen bonds are also present.

## **Construction of a dinuclear silver(I) coordination complex with a Schiff base containing 4-amino-1,2,4-triazole ligands**

**Q. Sun, F. Zheng, X. Sun and W. Wang**

### **Comment**

1,2,4-triazoles and their derivatives are interesting bridging ligands. 1,2,4-triazoles can coordinate with metals by bridging two adjacent nitrogen atoms (N1 and N2) or via the 4-positioned one (N4). It is also a readily available and inexpensive resource. In the past two decades, a variety of coordination compounds containing 1,2,4-triazoles, N4 substituted 1,2,4-triazoles and their derivatives as ligands coordinated to metal ions have been reported (Beckmann & Brooker, 2003; Garcia *et al.*, 1997; Klingele & Brooker, 2003; Liu *et al.*, 2006; Liu *et al.*, 2003; Yi *et al.*, 2004; Zhai *et al.*, 2006). Relatively few structurally characterized compounds based on 4-amido-1,2,4-triazoles Schiff base ligands have been reported (Drabent *et al.*, 2004 and 2003; Wang *et al.*, 2006). Here we describe the synthesis of the Ag(I) metal complex with a Schiff-base containing triazole ligand.

The molecular structure of complex 1 is shown in Figure 1. It consists of a discrete binuclear complex of Ag(I) bridged by two N1,N2-coordinated triazole ligands and an additional triazole ligand is bound to the Ag(I) ion in a monodentate fashion. This coordination mode results in a trigonal planar coordination environment (the sum of the angles around Ag metal atom is equal to 360 °). The Ag—Ag distance is equal to 3.81 Å, which is over the summed van der Waals radii of two Ag(I) atoms (3.44 Å) (Han *et al.*, 2004). The Ag—N bond distances are in the range of 2.18–2.33 Å. The six-membered Ag-[N—N]₂-Ag rings remain almost planar (the mean plane deviation is 0.06 Å) from planarity, which is similar with dinuclear Cu(I) complex (Drabent *et al.*, 2004). The Ag—N—N—Ag dihedral angle is 15.1 °.

In this complex all the ligands *L* are coordinated in almost planar E configuration and the resulting binuclear units can be described as X-shaped dimers. Sheets formed through C-H···O hydrogen bonds are further aggregated into three-dimensions by weak π-π stacking interactions between the naphthalene rings of the neighbouring dimers in different sheets and the shortest atom···atom separation is *ca* 3.46 Å between the parallel stacking pairs. The anions and water molecules interact with one another through O—H···N, O—H···O hydrogen bonds.

### **Experimental**

Preparation of complex 1: The ligand *L* (0.1 mmol, 0.024 g) and AgNO<sub>3</sub> (0.1 mmol, 0.017 g) were mixed in acetonitrile and stirred at room temperature for one hour, the yellow solution was filtered and evaporated at room temperature. A few days later orange block crystals were obtained.

Preparation of the ligand *L*: An ethanolic solution (20 ml) of 2-hydroxy-1-naphthaldehyde (1.72 g, 10 mmol) was added to a warm ethanolic solution (10 ml) of 4-amino-1,2,4-triazole (0.84 g, 10 mmol) and the resulting solution was refluxed for four hours. The reaction mixture was then cooled to room temperature. Upon standing overnight the resultant yellow solid was filtered off, washed with diethyl ether and dried under vacuum. Yield: 90%. <sup>1</sup>H NMR (500 MHz, DMSO, 298 K): 9.66 (s, 1H), 9.34 (s, 2H), 8.84–8.86 (d, 1H), 8.05–8.07 (d, 1H), 7.90–7.92 (d, 1H), 7.61–7.64 (t, 1H), 7.43–7.46 (t, 1H), 7.28–7.30 (d, 1H).

## Refinement

All of the non-hydrogen atoms were refined with anisotropic thermal displacement coefficients. The positions of hydrogen atoms were fixed geometrically at calculated distances and allowed to ride on the parent non-hydrogen atoms. The water molecule was refined as disordered with the s.o.f. being fixed at 0.5 and its hydrogen atoms located in the difference Fourier maps and fixed at calculated distances from the parent oxygen atom.

## Figures

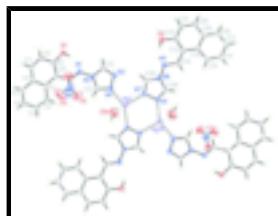

Fig. 1. A perspective view of the molecular structure showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. [symmetry code: (A)  $2 - x, -y, 2 - z$ .]

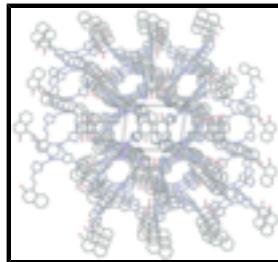

Fig. 2. A packing diagram for the crystal along  $b$  axis, the  $\text{NO}_3^-$ ,  $\text{H}_2\text{O}$  and hydrogen atoms are omitted for clarity.

## **bis[ $\mu$ -1-(1,2,4-triazol-4-yliminomethyl)-2-naphthol]bis{[1-(1,2,4-triazol-4-yliminomethyl)-2-naphthol]silver(I)} dinitrate monohydrate**

### Crystal data

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: geom, H2O from difmap
$R[F^2 > 2\sigma(F^2)] = 0.055$	H-atom parameters constrained
$wR(F^2) = 0.133$	$w = 1/[\sigma^2(F_o^2) + (0.0601P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.00$	$(\Delta/\sigma)_{\text{max}} = 0.001$
4536 reflections	$\Delta\rho_{\text{max}} = 0.85 \text{ e \AA}^{-3}$
379 parameters	$\Delta\rho_{\text{min}} = -0.84 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
