Table of contents

Appendix Figure S1

Appendix Figure S1

A. Original *in situ* hybridization staining of human CRC tissue prior to αSMA counter staining from Figure 1B for improved visualization of tissue structure. The same field of view and outlined region of interest (black rectangle) are shown. Scale bar = 100 μm. **B**. Cycle threshold value (Ct) of *Fn* 71 qPCR in stool from the germ free *CDX2-CreER^T2^Apc^fl/fl^* experiment, corresponding to main Figure 1D-E, collected at end point (n = 5 PBS- and 4 *Fn*-treated mice). **C.** Representative immunofluorescent image showing no colocalization of *Fn* (red, stained with an OMP *Fn* specific antibody) with the stromal marker PDPN (green), and DAPI (grey) in the colon from a PBS-gavaged *CDX2-CreER^T2^Apc^fl/fl^* mouse (as a control for the main Figure 1E). Scale bar = 50 μm. **D.** Example flow cytometry histogram of bound or invading CFSE-stained-bacteria (*Fn* 25586, *Fn* 23726, *Fn* 71 or *Ec*, MOI 50, 4-hour co-culture) in CT5.3 CAFs, corresponding to main Figure 1H. **E**. Viability staining of a representative CT5.3 CAF co-cultured with MOI 50 *Fn* 71 for four hours (n = 1 independent experiment). Live extracellular *Fn* are indicated by the asterisk (*) and are OMP+ as well as Hoechst+. Dead extracellular *Fn* are indicated by the dashed arrow and are OMP+, PI+ and Hoechst+. Dead intracellular bacteria are indicated by a solid arrow and are Hoechst+ and PI+. And finally, live intracellular bacteria, indicated by the arrowhead, are only Hoechst+. The dashed line surrounding the pink area encloses the nuclei of the resident CAF. Scale bar = 5 μm. The horizontal line in B shows the mean.

C Lamin A/C

D PDPN

E PDPN

F
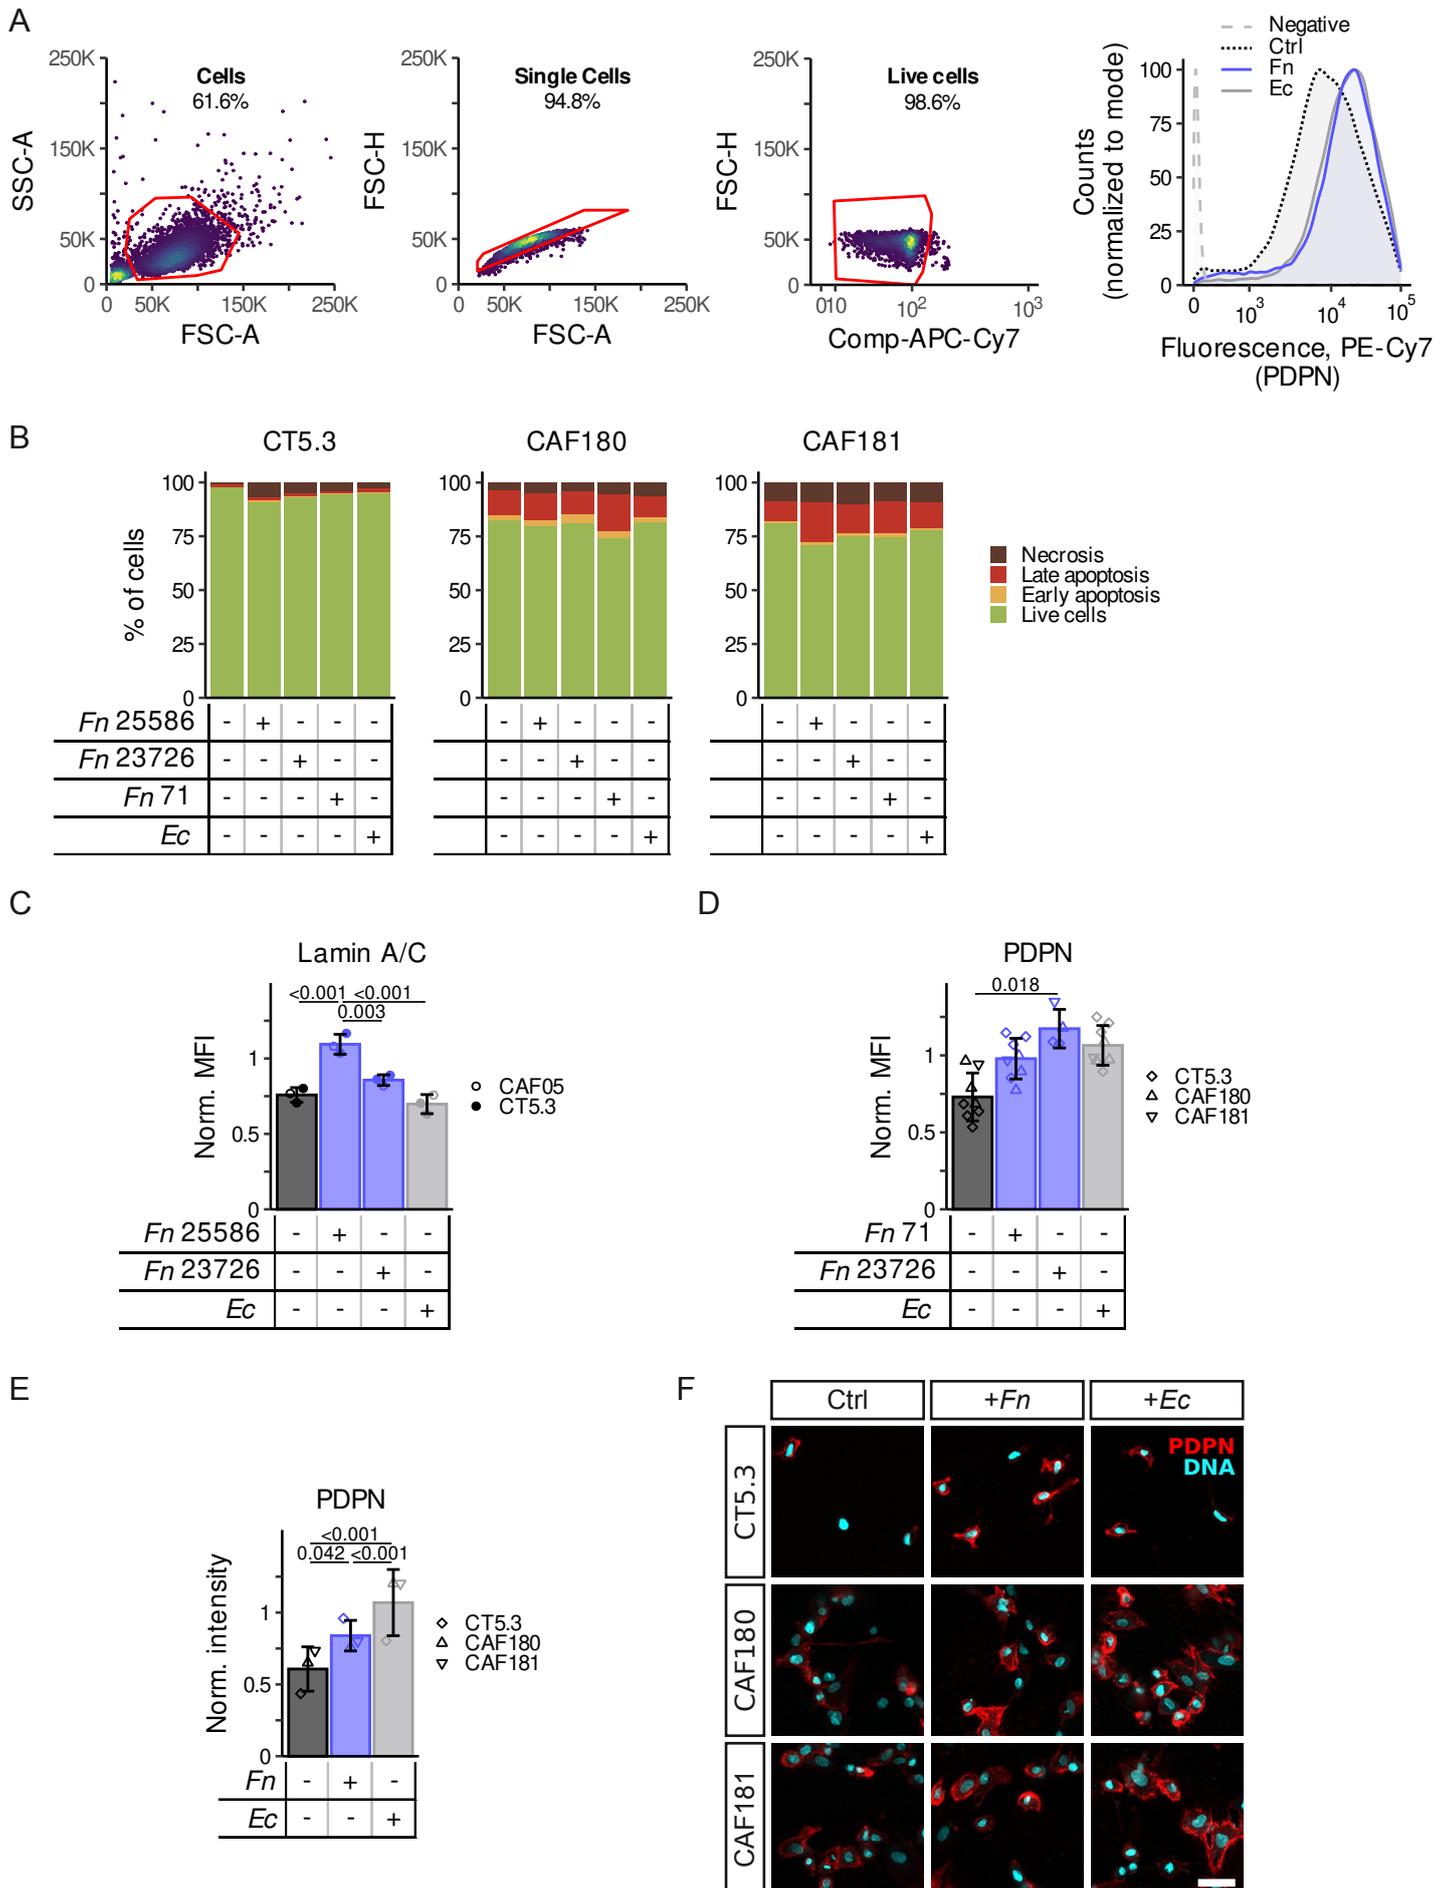

Appendix Figure S2

A. Flow cytometry gating strategies of the CAF markers, here podoplanin (PDPN). **B.** Cell viability of CT5.3 CAFs and the patient derived CAF180 and CAF181 CAFs treated with *Fn* 25586, *Fn* 23726, *Fn* 71 or *Ec* for four hours at an MOI of 50, determined by the Annexin IV assay via flow cytometry (n = 3 independent experiments). **C.** Expression of Lamin A/C 24 hours after a two-hour treatment with either *Fn* 25586, *Fn* 23726 or *Ec* (MOI 500) as measured by flow cytometry (Each data point represents a technical replicate from n = 2 independent experiments). **D.** Expression of PDPN in CT5.3 CAFs 24 hours after a four-hour treatment with either *Fn* 25586, *Fn* 23726 or *Ec* (MOI 50) as measured by flow cytometry (n = 3 independent experiments). **E.** Normalized mean fluorescent intensity of PDPN in the cytoplasm of CT5.3 cells treated for four hours with *Fn* 71 or *Ec* (MOI 50, n = 1 independent experiment). **F.** Representative immunofluorescent images of PDPN (red) staining, quantified in E, counter stained with DAPI (blue). Scale bar = 20 μm. PDPN = podoplanin. The bar chart and error bars show the mean ± SD and statistically significant differences were determined using a nested ANOVA followed by Tukey's HSD post-hoc test.
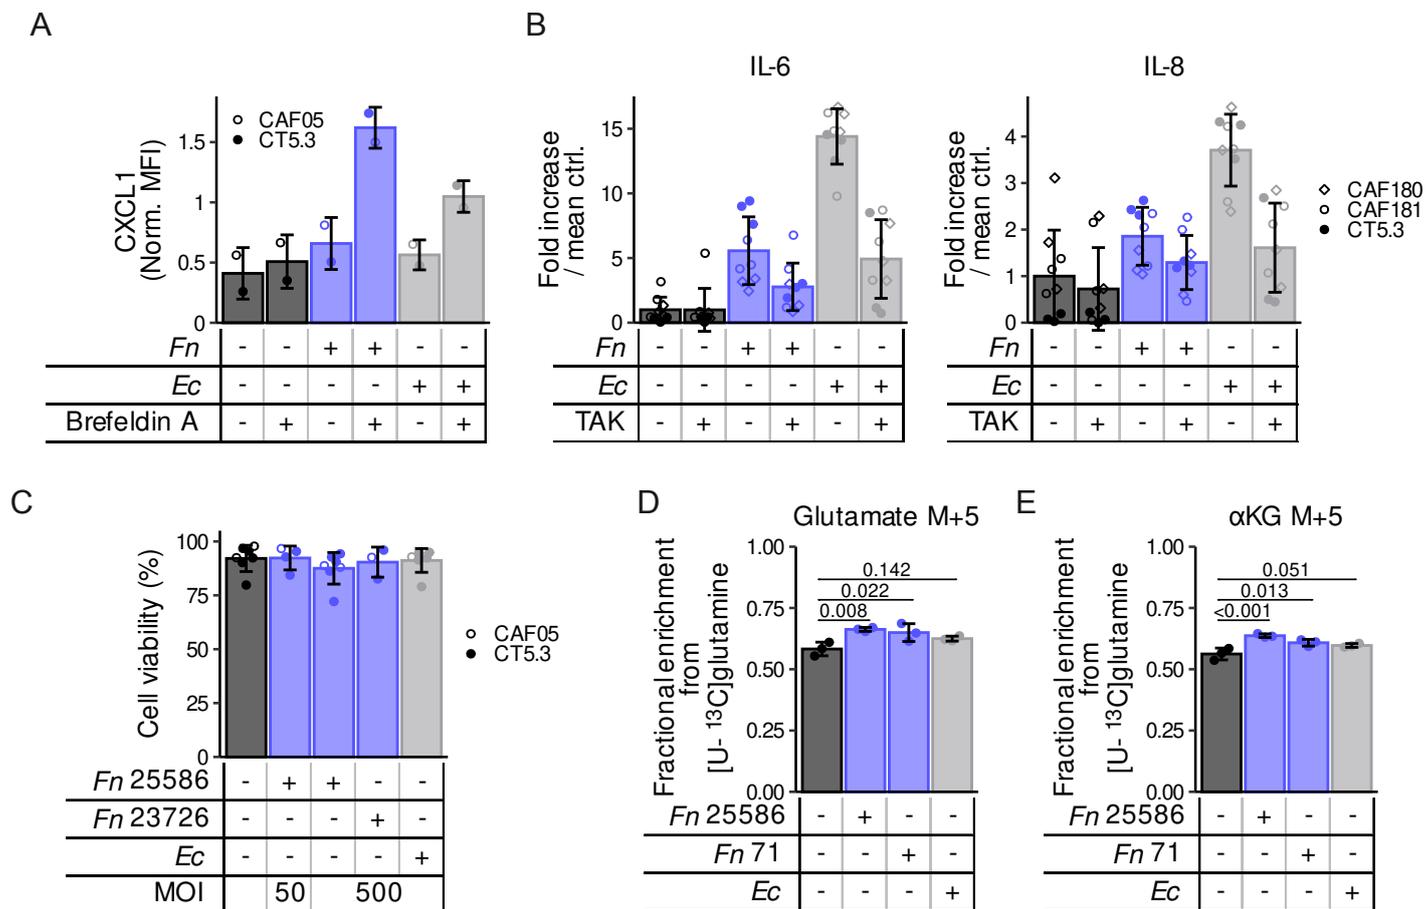

Appendix Figure S3

A. CXCL1 quantified by flow cytometry after 24 hours in CT5.3 and CAF05 CAFs co-incubated with *Fn* 25586 or *Ec* for two-hours (MOI 500), and upon treatment with Brefeldin A (n = 1 independent experiments for CAF05 and CT5.3). **B.** ELISA results for IL-6 and IL-8 replotted from the main Figure 4C and D, with the additional conditions of TAK-242, a TLR4 inhibitor, pre-treatment (n = 3 independent experiments with 3 independent cell lines). **C**. Cell viability of CAFs treated with *Fn* 25586, *Fn* 23726 or *Ec* for two-hours (MOI 500). CAF05 and CT5.3 cell viabilities were assessed by live/dead staining by flow cytometry (summarized from 7 independent experiments with 4-7 replicates per condition). **D-E.** Fractional enrichment in M+5 glutamate (**D**) and M+5 alpha-ketoglutarate (**E**) from [U-13C]glutamine after a four-hour co-culture of CT5.3 with either *Fn* 71, *Fn* 25586, *Ec* or PBS control (MOI 50), followed by a 24-hour incubation with [U13C]glutamine. The bar chart and error bars show the mean ± SD and statistically significant differences were determined using a nested ANOVA followed by Tukey's HSD post-hoc test.
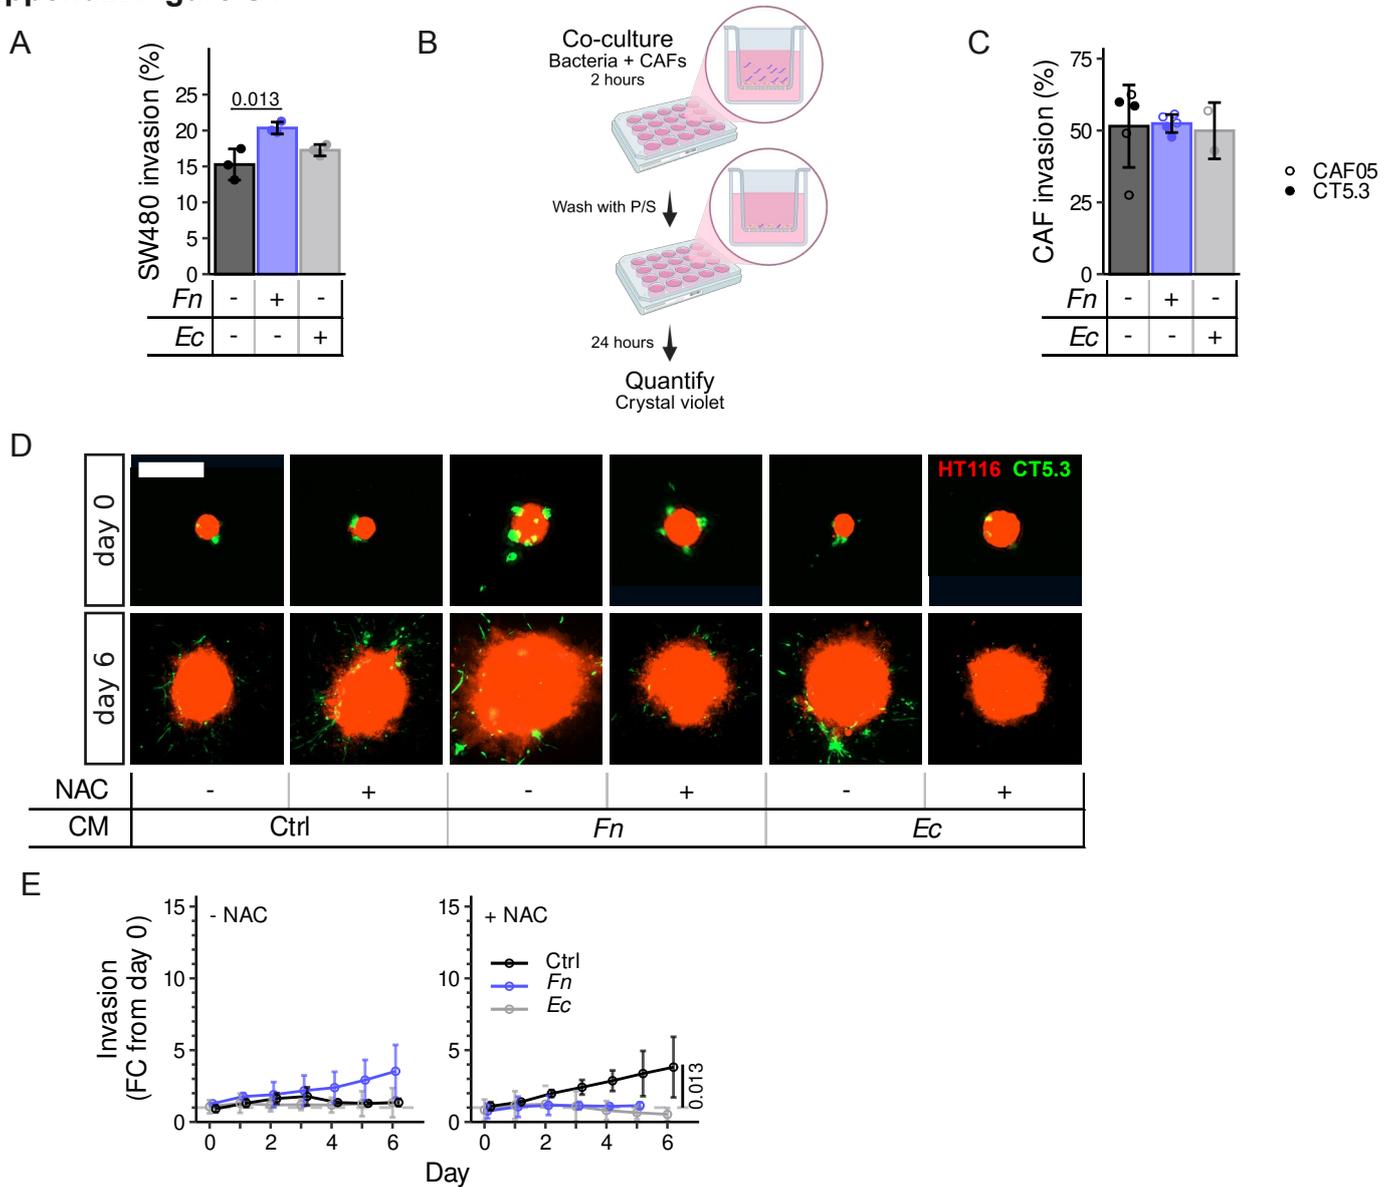

Appendix Figure S4

Appendix Figure S4

A. Percentage of SW480 cells that invaded upon co-culture with four-hour non- and bacteria (*Fn* 71 and *Ec*)-treated CT5.3 CAFs (MOI 50, n = 3 biological replicates). **B**. Schematic representation of the Transwell assay for CAF invasion. **C.** Percentage of CAFs that migrated after 24 hours post two-hour co-culture with *Fn* 25586 or *Ec* (MOI 500, n = 3 and n = 2 independent experiments for CAF05 and CT5.3, respectively). **D**. Representative pictures of the *in vitro* complex 3D co-culture experiment. Overlay shows mCherry HCT116 cells in red and GFP CT5.3 in green. Pictures represent 3 independent experiments with a minimum of 2 technical replicates included per experiment. Scale bar = 1 mm. **E**. Invasion of the 3D complex spheroid models as quantified by CT5.3 (GFP) outgrowth from the core normalized to day 0 over the total span of the experiment, 6 days (n = 3 independent experiments, a minimum of 2 technical replicated included per experiment).The data points and error bars show the mean ± SD and statistically significant differences were determined using pairwise 2-way repeated measure ANOVAs (time × treatment). The interaction term p-values were adjusted using Holm's method.

Appendix Table S1 – List of cell lines

Cell line	Supplier
CT5.3 hTERT, Immortalized Human Colonic Tumor Fibroblast	Cancer Research Institute Ghent
CAF05, Commercial Human Colorectal Tumor Fibroblast	Neuromics
HCT116	ATCC
HT-29	ATCC
SW480	ATCC
T4/CAF4	
CAF12	
CAF16	
CAF19	
CAF20	Primary derived cell line
CAF22	from in house CRC patient cohort
CAF32	
CAF41	
CAF42	
CAF180	
CAF181	

Appendix Table S2 – List of bacterial strains

Bacteria	Supplier
Fusobacterium nucleatum subsp. *Nucleatum* 25586	ATCC
Fusobacterium nucleatum subsp. *Nucleatum* 23726	ATCC
Fusobacterium nucleatum subsp. *Animalis* 7_1	Virginia Tech
Fap2 mutant *Fusobacterium nucleatum* subsp. *Nucleatum* 23726	Jorg Vogel
FadA mutant *Fusobacterium nucleatum* subsp. *Nucleatum* 23726	Jorg Vogel
Escherichia coli K-12 MG1655	ESB group, LCSB

Appendix Table S3 – Vectors and oligonucleotides used to generate *FnΔfap2*

Strain ID	Original strain	Description	Origin
FPS-649	*Δfap2 Fusobacterium nucleatum* subsp. *nucleatum* ATCC 23726	deletion of full-length *fap2*; deletion carried according to protocol described in methods and PMID: 36161895	This study
FPS-189	*ΔfadA Fusobacterium nucleatum* subsp. *nucleatum* ATCC 23726	deletion of full-length *fadA*	PMID: 36161895

Strain ID	Description	Origin
pVoPo-04	base vector; markerless gene deletion vector for *F. nucleatum*	PMID: 36161895
pFP468	pVoPo-04-fap2; gene deletion vector for *fap2*	this study

Oligo ID	Sequence	Description
JVO-20976	aattttttacttatattttatcgatcGTAGTGATAAAGATGCTGGAAAAAATAC	Gibson Assembly; forward *fap2* homolog arm upstream
