In the title compound,  $C_{12}H_{19}NO_6$ , the six-membered 1,3-dioxane ring adopts a chair-like conformation. The seat of this chair, containing two O atoms, is essentially planar, with a maximum deviation of 0.0021 (12) Å. The five-membered oxolane ring *cis*-fused to the 1,3-dioxane ring adopts an envelope form. The bridgehead C atom at the flap, which is bonded to the tetrasubstituted C atom of the oxolane ring, deviates from the mean plane of other ring atoms by 0.539 (4) Å. In the crystal, classical O—H···O and N—H···O hydrogen bonds link the molecules into a sheet structure enclosing an  $R^4_4(24)$  graph-set motif. Weak intermolecular C—H···O interactions support the sheet formation.

## 1. Chemical context

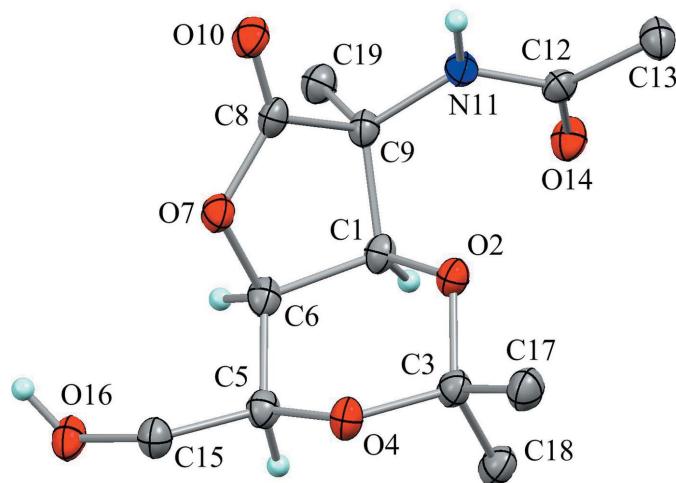

Sphingofungin F [systematic name: (2*S*,3*R*,4*R*,5*S*,*E*)-2-amino-3,4,5-trihydroxy-2-methyl-14-oxoicos-6-enoic acid] was isolated from the fermentation broth of *Paecilomyces variotii* by Horn *et al.* (1992). It shows antifungal activity by inhibition of the serine palmitoyltransferase to suppress the early step of biosynthesis of the sphingosines (Zweerink *et al.*, 1992). The structure of sphingofungin F features a hydrophilic  $\alpha,\alpha$ -disubstituted  $\alpha$ -amino acid moiety possessing four contiguous stereocenters, connected to a hydrophobic carbon chain by *E*-olefin. The title compound, which is equivalent to the hydrophilic part with correct stereochemistry, was provided in the total synthesis of sphingofungin F (Tsuzaki *et al.*, 2015).

OPEN ACCESS

## 2. Structural commentary

The molecular structure of the title compound is shown in Fig. 1. The 1,3-dioxane ring (C1/O2/C3/O4/C5/C6) is in a chair-like conformation with puckering parameters of  $Q = 0.497$  (3) Å,  $\theta = 169.6$  (3)°,  $\varphi = 116.8$  (16)°,  $Q(2) = 0.090$  (3) Å

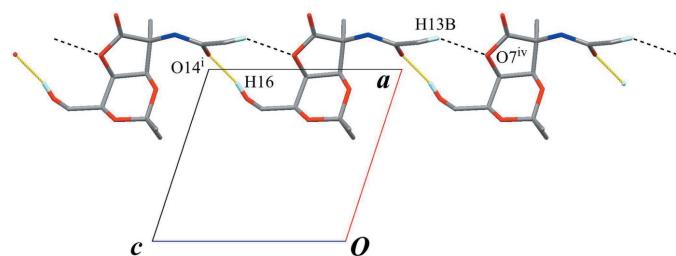

**Figure 1**

The molecular structure of the title compound, showing the atom labeling. Displacement ellipsoids are drawn at the 50% probability level. Only H atoms connected to N, O and chiral C atoms are shown for clarity.

and  $Q(3) = -0.489 (3)$  Å. The seat of this chair ( $C1/O2/O4/C5$ ) is essentially planar with a maximum deviation of 0.0021 (12) Å for O4, and atoms C6 and C3, positioned at the headrest and the footrest, respectively, deviate from the mean plane of the seat by 0.524 (4) and -0.646 (3) Å. The equatorially oriented C5—C15 and C3—C17 bonds make angles with the normal of the Cremer & Pople plane being 63.41 (18) and 63.35 (18)°, respectively, while the C1—C9 bond is a little tilted from the ideal equatorial position with an angle of 50.50 (17)° due to the ring-fusion system. The oxolane ring ( $C1/C6/O7/C8/C9$ ), which is *cis*-fused to the 1,3-dioxane ring, adopts an envelope form with puckering parameters of  $Q(2) = 0.345 (3)$  Å and  $\varphi(2) = 254.7 (4)$ °. The bridgehead atom C1 deviates from the mean plane of the other four ring atoms by 0.539 (4) Å.

### 3. Supramolecular features

In the crystal, an O—H···O hydrogen bond ( $O16\cdots O14^i$ ; Table 1) connects the molecules into a chain structure running along the  $c$  axis, with a  $C(10)$  graph-set motif

**Figure 2**

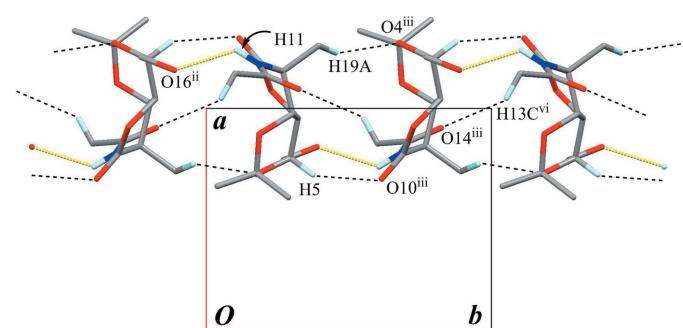

A partial packing diagram, viewed down the  $b$  axis, showing the chain structure running along the  $c$  axis. Yellow lines indicate the intermolecular O—H···O hydrogen bonds. Black dashed lines indicate weak intermolecular C—H···O interactions. Only H atoms involved in the hydrogen bonds are shown for clarity. [Symmetry codes: (i)  $x, y, z + 1$ ; (iv)  $x, y, z - 1$ .]

**Table 1**  
Hydrogen-bond geometry (Å, °).

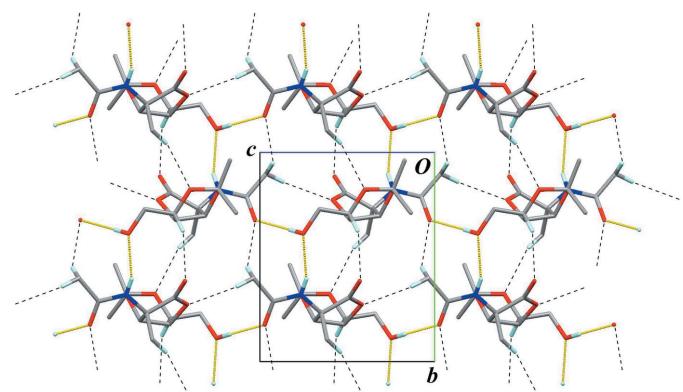

$D\cdots H\cdots A$	$D—H$	$H\cdots A$	$D\cdots A$	$D—H\cdots A$
$O16—H16\cdots O14^i$	0.84	1.91	2.742 (2)	168
$N11—H11\cdots O16^{ii}$	0.88	2.28	2.928 (3)	131
$C5—H5\cdots O10^{iii}$	1.00	2.42	3.289 (3)	145
$C19—H19A\cdots O4^{iii}$	0.98	2.52	3.386 (3)	147
$C13—H13B\cdots O7^{iv}$	0.98	2.55	3.433 (3)	150
$C13—H13C\cdots O14^{v}$	0.98	2.62	3.424 (3)	140

Symmetry codes: (i)  $x, y, z + 1$ ; (ii)  $-x + 2, y - \frac{1}{2}, -z + 1$ ; (iii)  $-x + 2, y + \frac{1}{2}, -z + 1$ ; (iv)  $x, y, z - 1$ ; (v)  $-x + 2, y - \frac{1}{2}, -z$ .

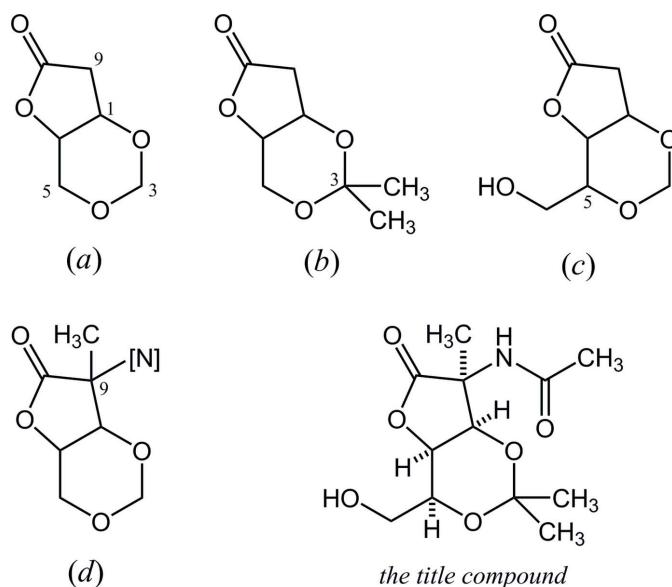

(Fig. 2). A weak C—H···O interaction ( $C13—H13B\cdots O7^{iv}$ ; Table 1) supports formation of the chain. The chains are linked into a sheet structure parallel to (100) by an N—H···O hydrogen bond ( $N11—H11\cdots O16^{ii}$ ; Table 1) which generates a  $C(8)$  graph-set motif (Fig. 3). Weak C—H···O interactions ( $C5—H5\cdots O10^{iii}$ ,  $C19—H19A\cdots O4^{iii}$  and  $C13—H13C\cdots O14^{v}$ ; Table 1) are also observed between the chains. In this sheet structure, the classical O—H···O and N—H···O

**Figure 3**

Another partial packing diagram, viewed down the  $c$  axis, showing the sheet structure parallel to (100). Yellow lines indicate the intermolecular N—H···O hydrogen bonds. Black dashed lines indicate weak intermolecular C—H···O interactions. Only H atoms involved in the hydrogen bonds are shown for clarity. [Symmetry codes: (ii)  $-x + 2, y - \frac{1}{2}, -z + 1$ ; (iii)  $-x + 2, y + \frac{1}{2}, -z + 1$ ; (vi)  $x, y + 1, z + 1$ .]

**Figure 4**

A packing diagram, viewed down the  $a$  axis, showing the hydrogen bonds in the sheet structure parallel to (100). Yellow lines indicate intermolecular O—H···O and N—H···O hydrogen bonds. Black dashed lines indicate weak intermolecular C—H···O interactions. Only H atoms involved in the hydrogen bonds are shown for clarity.

**Figure 5**

The core structures for database survey: (a) 2,4,7-trioxabicyclo[4.3.0]nonan-8-one, and its derivatives with (b) 3,3-dimethyl, (c) 5-hydroxymethyl and (d) 9-methyl-9-N-substituents.

hydrogen bonds enclose an  $R^4_4(24)$  graph-set motif, and the other weak C–H $\cdots$ O interactions add to the stability of the network (Fig. 4).

#### 4. Database survey

In the Cambridge Structural Database (CSD, Version 5.37, November 2015; Groom *et al.*, 2016), 18 structures containing a 2,4,7-trioxabicyclo[4.3.0]nonan-8-one skeleton, (a), are registered (Fig. 5). These include five compounds (YISHIR and YISHUD: Han *et al.*, 1994; LAVVIO: Watkin *et al.*, 2005; ZINDEH and ZINDIL: Glawar *et al.*, 2013) with 3,3-dimethyl substituents, (b); one compound (NUIJAS: Henkel *et al.*, 1998) with 5-hydroxymethyl substituent, (c); and one compound (QIFFUH: Hotchkiss *et al.*, 2007) possessing a tetrasubstituted carbon with nitrogen at the C-9 position, (d). The conformations of the bicyclic systems in these seven structures are similar to those in the title compound: the 1,3-dioxane rings adopt chair-like forms, and the *cis*-fused oxolane rings adopt envelope forms with bridgehead C-1 position at the flap.

#### 5. Synthesis and crystallization

The title compound was afforded in the total synthesis of sphingofungin F from a D-ribose derivative (Tsuzaki *et al.*, 2015). Purification was carried out by silica gel column chromatography, and colorless crystals were obtained from an ethyl acetate solution under a hexane-saturated atmosphere, by slow evaporation at ambient temperature. M.p. 497–498 K.  $[\alpha]^{28}_D + 157.7$  (*c* 1.04,  $\text{CHCl}_3$ ). HRMS (ESI)  $m/z$  calculated for  $\text{C}_{12}\text{H}_{19}\text{NO}_6\text{Na}^+ [M + \text{Na}]^+$ : 296.1110; found: 296.1104.

Computer programs: APEX2 and SAINT (Bruker, 2014), SHELXS2013 (Sheldrick, 2008), SHELXL2014 (Sheldrick, 2015), Mercury (Macrae *et al.*, 2006), publCIF (Westrip, 2010) and PLATON (Spek, 2009).

#### 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. C-bound H atoms were positioned geometrically with C–H = 0.95–1.00 Å, and constrained to ride on their parent atoms with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  or  $1.5U_{\text{eq}}(\text{methyl C})$ . The hydroxy H atom was placed guided by difference maps, with O–H = 0.84 Å and with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ . The amide H atom was also placed guided by difference maps, with N–H = 0.88 Å and with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$ .

### Special details

**Experimental.** IR (KBr): 3311, 2967, 2896, 1785, 1658, 1539, 1170, 1117, 1057 cm<sup>-1</sup>; <sup>1</sup>H NMR (500 MHz, CDCl<sub>3</sub>):  $\delta$  (p.p.m.) 5.91 (s, 1H; H11), 4.82 (d,  $J$  = 2.0 Hz, 1H; H1), 4.37 (dd,  $J$  = 2.0, 1.7 Hz, 1H; H6), 4.21 (ddd,  $J$  = 7.2, 5.5, 1.7 Hz, 1H; H5), 3.92–3.79 (m, 2H; H15AB), 2.05 (bs, 1H; H16), 2.00 (s, 3H; H14ABC), 1.60 (s, 3H; H19ABC), 1.46 (s, 3H; H18ABC), 1.35 (s, 3H; H17ABC); <sup>13</sup>C NMR (125 MHz, CDCl<sub>3</sub>):  $\delta$  (p.p.m.) 176.9 (C), 170.1 (C), 98.8 (CH), 71.6 (CH), 71.5 (CH), 68.9 (CH), 62.3 (CH<sub>2</sub>), 61.6 (C), 29.1 (CH<sub>3</sub>), 23.5 (CH<sub>3</sub>), 19.2 (CH<sub>3</sub>), 18.0 (CH<sub>3</sub>).

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
