Received 25 May 2012; accepted 11 July 2012

Key indicators: single-crystal X-ray study; $T = 173\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.009\text{ \AA}$; R factor = 0.092; wR factor = 0.299; data-to-parameter ratio = 21.3.

In the title compound, $\text{C}_{16}\text{H}_{20}\text{N}_2\text{S}$, a potential tetrahydroisoquinoline (TIQ) thiazole ligand, the N-containing six-membered ring of the TIQ unit adopts a half-chair conformation. There are four molecules in the asymmetric unit. No classical hydrogen bonds or $\pi-\pi$ interactions were found in the crystal structure.

Comment

We have recently reported a range of tetrahydroisoquinoline (TIQ) structures that have been employed as ligands for catalysis of a number of reactions, Chakka *et al.* 2010, Naicker *et al.*, 2010, Kawthekar *et al.*, 2010 and Peters *et al.*, 2010. The title compound is from a new family of TIQ thiazole derivatives that we have tested for catalytic activity in the Henry reaction, (Pawar *et al.*, 2012).

The absolute stereochemistry was confirmed to be *S* at the C9 position from two-dimensional NMR spectroscopy experiments (Aubry *et al.*, 2006), (Fig. 1). From the crystal structure it is evident that the *N*-containing six membered ring assumes a half chair conformation [$Q = 0.493$ (6) Å, $\theta = 49.5$ (7)° and $\varphi = 322.8$ (9)°]. This is similar to our previously reported structures which also assume this conformation (Naicker *et al.*, 2011*a,b* and Pawar *et al.* 2011). The torsion angle for C1A—N1A—C9A—C10A is -170.1 (5)°; C1B—N1B—C9B—C10B is -173.4 (5)°; C1C—N1C—C9C—C10C is -170.5 (5)° and C1D—N1D—C9D—C10D is -169.1 (5)°. For the plane formed by the atoms C1—C2—C7—C8—C9—N1 the maximum displacement from planarity for N1A is 0.446 Å and for C9A 0.299 Å; N1B is 0.384 Å and for C9B 0.296 Å; N1C is 0.427 Å and for C9C 0.258 Å and N1D is 0.286 Å and for C9D 0.473 Å. There are no hydrogen bonding or $\pi-\pi$ interactions in the crystal lattice.

Experimental

The *N*-protected thiazole (3 mmol) was dissolved in THF (15 ml), to this 12 *M* HCl (15 ml) was added slowly and the reaction mixture was stirred at room temperature for 2 h. The reaction was monitored by TLC using EtOAc/Hexane (20:80, $R_f = 0.5$). After this time the THF was evaporated under vacuum. Aqueous saturated NaHCO₃ solution, was then slowly poured into the mixture which was then extracted with CH₂Cl₂ (3 x 30 ml). The combined organic layers were dried over MgSO₄. The solvent was then evaporated under reduced pressure. The residue was purified by column chromatography on silica gel (deactivated with 5% Et₃N) with Et₃N/EtOAc/Hexane (5/8/100) as the eluent to afford the TIQ thiazole as a yellow solid (0.27 g, yield 95%).

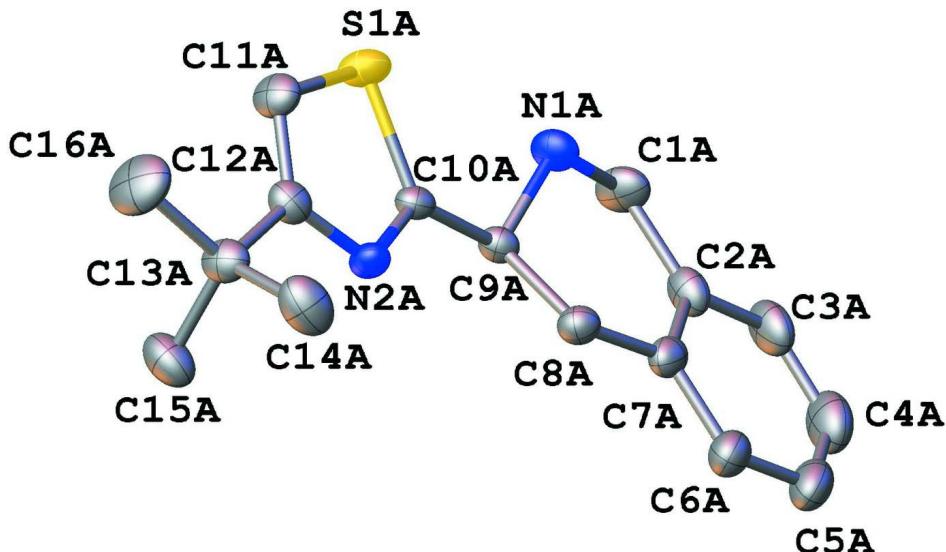

Recrystallization from mixture of hexane and dichloromethane at room temperature afforded colourless crystals suitable for X-ray analysis.

Refinement

The crystal was twinned. When the structure was attempted to be refined with a P21/c space group the *R* factor rose to 20%. All hydrogen atoms, except H1A, H1B, H1C and H1D, were positioned geometrically with C—H distances ranging from 0.95 Å to 0.99 Å and refined as riding on their parent atoms with U_{iso} (H) = 1.2 - 1.5 U_{eq} (C). The positions of H1A, H1B, H1C and H1D were located in difference electron density maps and refined with bond length constraints [$d(\text{N—H}) = 0.97$ (2) Å] and $U_{\text{iso}} = 1.5 U_{\text{eq}}$ (N).

Special details

Experimental. Half sphere of data collected using the Bruker SAINT software package. Crystal to detector distance = 30 mm; combination of ϕ and ω scans of 0.5°, 30 s per °, 2 iterations.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
