The title compound, $C_{21}H_{25}NO_3$, crystallized as a racemic twin in the Sohnke space group $P2_1$. In the molecular structure of the title compound, both enantiomers show a highly similar conformation with the urethane function and the benzoyl group showing an almost perpendicular arrangement [the dihedral angle is $72.46(8)^\circ$ in the *S*-enantiomer and $76.21(8)^\circ$ in the *R*-enantiomer]. In the crystal structure, molecules of both enantiomers show infinite helical arrangements parallel to the *b* axis formed by weak C—H···O hydrogen bonds between the phenyl ring of the benzoyl group and the carbamate carbonyl group. In case of the *R*-enantiomer, this helix is additionally stabilized by a bifurcated hydrogen bond between the carbonyl function of the benzoyl group towards both phenyl groups of the molecule.

1. Chemical context

Phenacyl and desyl compounds may act as photoremovable protecting groups (PPGs) and have been a subject of interest for many years (Givens *et al.*, 2012; Kammari *et al.*, 2007; Klán *et al.*, 2013; Sheehan & Umezawa, 1973). In addition to the protection of carboxylic acids, they have also been shown to act as suitable groups for the protection and deprotection of amines (Speckmeier *et al.*, 2018). Besides several carbamate compounds, Lange and co-workers also synthesized the title compound *via* a Cu^I-catalysed stereospecific coupling reaction using α -stannylated benzyl carbamates (Lange *et al.*, 2008). We chose a different procedure to synthesize the title compound, according to a synthetic route that has already been reported by Speckmeier *et al.* (2018). Recently, we reported on the crystal structure of the highly related achiral derivative 2-oxo-2-phenylethyl diisopropylcarbamate (Martens *et al.*, 2021).

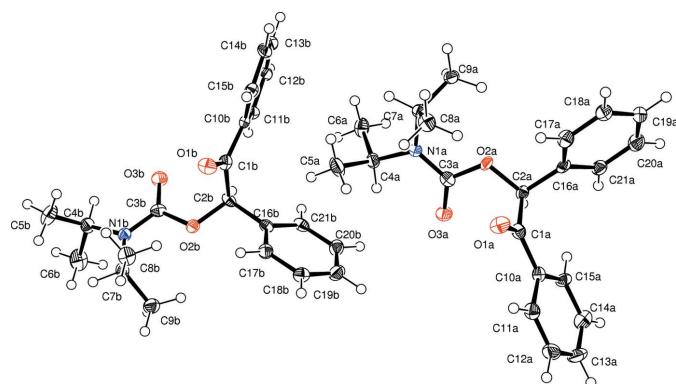

2. Structural commentary

The carbamate functional moieties (*S*-enantiomer: N1A/C3A/O3A/O2A; *R*-enantiomer: N1B/C3B/O3B/O2B) are essen-

**Figure 1**

Molecular structures of both enantiomers of the title compound with displacement ellipsoids drawn at the 50% probability level (*R* left; *S* right).

tially planar with the largest deviation for the respective planes being observed for C3A and C3B (in both cases 0.01 Å). The same is true for the benzoyl groups (*S*-enantiomer: C1A/O1A/C10A–C15A; *R*-enantiomer: C1B/O1B/C10B–C15B). In case of the *S*-enantiomer, the carbamate and the benzoyl planes subtend a dihedral angle of 77.46 (8)° whereas for the *R*-enantiomer an angle of 76.21 (8)° is observed (Fig. 1). These angles show a higher deviation from a perpendicular arrangement than was observed for 2-oxo-2-phenylethyl diisopropylcarbamate (Martens *et al.*, 2021), most probably caused by the enhanced steric requirements of the phenyl substituent at C2A or C2B, respectively. All other bond lengths and angles are of expected values with C3A –

C11B—H11B···O1B ⁱⁱⁱ	0.95	2.69	3.553 (2)	152
C21B—H21B···O1B ⁱⁱⁱ	0.95	2.62	3.522 (2)	158

Symmetry codes: (i) $-x + 2, y + \frac{1}{2}, -z$; (ii) $-x + 1, y + \frac{1}{2}, -z + 1$; (iii) $x, y - 1, z$.

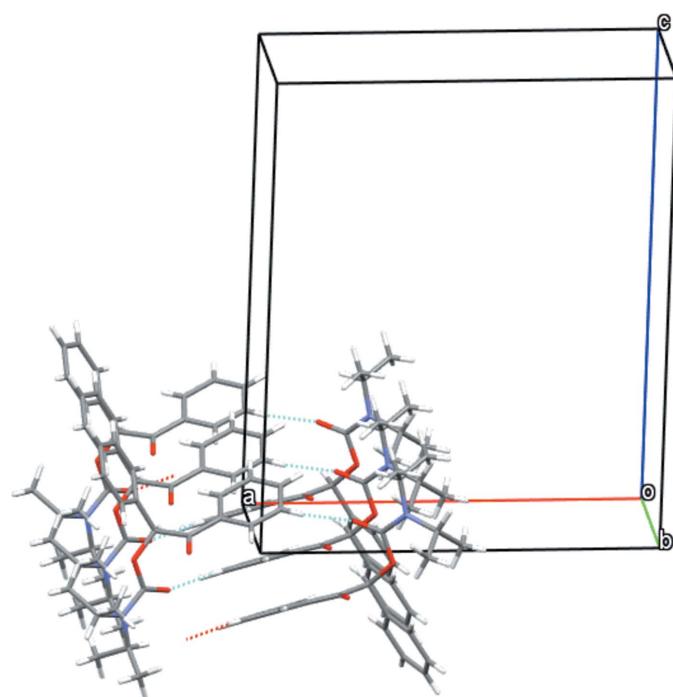

N1A [1.354 (7) Å], C3A—O2A [1.360 (7) Å], C3B—N1B [1.350 (7) Å] and C3B—O2B [1.363 (6) Å] being slightly shorter than a typical C—O or C—N single bond due to the partial double-bond character of the respective bonds in a carbamate.

3. Supramolecular features

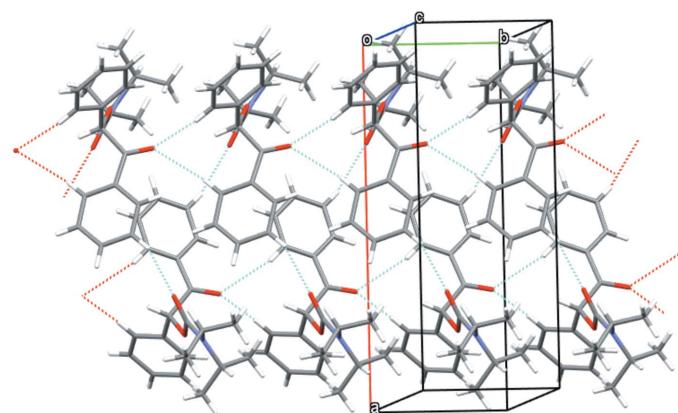

In the crystal structure, molecules of both enantiomers show infinite helical arrangements parallel to the *b* axis formed by weak C—H···O hydrogen bonds (Desiraju & Steiner, 2001; Figs. 2 and 3) between the phenyl ring of the benzoyl group and the carbamate carbonyl group (*S*-enantiomer: C12A—H12A···O3A, *R*-enantiomer: C14B—H14B···O3B; Table 1). In each of the helices, only one enantiomer is present. Nevertheless, the helices do not act as mirror images because the arrangement of the molecules relative to each other is different. In the case of the *R*-enantiomer (Fig. 3), the supramolecular helix is additionally stabilized by a bifurcated hydrogen bond between the carbonyl function of the benzoyl group towards both phenyl groups of the molecule (C11B—H12B···O1B and C12B—H12B···O1B; Table 1).

4. Database survey

In the Cambridge Structural Database (CSD; ConQuest Version 2020.3.0; Groom *et al.*, 2016) there is only one carbamate reported with a CH₂—C(O)—Ph group attached to the carbamate oxygen atom (NIWQUI; Jiang *et al.*, 2019). This

**Figure 2**

Crystal structure of the *S*-enantiomer of the title compound showing the helical arrangement of molecules parallel to the *b* axis built up by C—H···O hydrogen bonds.

**Figure 3**

Crystal structure of the *R*-enantiomer of the title compound showing the helical arrangement of molecules parallel to the *b* axis built up by C—H···O hydrogen bonds.

compound shows a diethylamino group and a *p*-chlorophenyl substituent instead of the diisopropylamino group and the non-substituted phenyl group as in the title compound. Contrary to the title compound, the carbamate plane and the benzoyl plane are almost coplanar. The carbonyl oxygen atoms show numerous short contacts towards different C—H groups of neighbouring molecules, leading to a dense three-dimensional network. In addition, we recently reported a structure, in which there also is a $\text{CH}_2\text{—C(O)—Ph}$ group instead of the $\text{CH}(\text{Ph})\text{—C(O)—Ph}$ unit in the title compound (Martens *et al.*, 2021). In this structure, a layered arrangement is realized by all three oxygen atoms acting as hydrogen-bond acceptor sites. Moreover, there is one structure reported in the literature that is identical to the title compound with the exception of one bromine substituent at the 4-position of the phenyl ring attached to the C1=O1 carbonyl group (DOKMAS; Lange *et al.*, 2008). In the latter case, the enantiopure *S*-enantiomer was crystallized. The supramolecular structure of this compound shows the same bifurcated hydrogen bond as is observed for the *R*-enantiomer of the title compound. On the other hand, the analogue of O3 is not engaged in a C—H···O interaction but shows a short oxygen–bromine contact (3.139 Å). These two interactions lead to a double-strand arrangement of molecules parallel to the *a* axis.

5. Synthesis and crystallization

Diisopropylamine (0.05 mol, 5.05 g) and one equivalent of caesium carbonate (0.05 mol, 16.55 g) were placed in a Schlenk tube and dissolved in anhydrous DMSO (150 ml). The tube was sealed with a septum, and two balloons filled with CO_2 were bubbled through the reaction mixture within one h while stirring. After the addition of CO_2 , 1.1 equivalents of 2-bromo-1,2-diphenylethan-1-one (0.055 mol, 15.13 g) dissolved in a small amount of DMSO were added in one portion. The consumption of the 2-bromo-1,2-diphenylethan-1-one was monitored by TLC, and after 30 min the reaction mixture was poured onto ice to quench the reaction. After extraction with dichloromethane (3×40 ml), the combined organic phases were washed with brine, separated and dried over Na_2SO_4 . The solvent was removed *in vacuo* and the crude product was recrystallized from *n*-hexane/ethylacetate (4:1, *v/v*) to afford the title compound (16.12 g; 95%) as a colourless crystalline solid. M.p. 485 K; ^1H NMR (500 MHz, CDCl_3) [ppm]: $\delta = 7.96$ (*dd*, 2H), 7.50–7.47 (*m*, 3H), 7.39–7.32 (*m*, 5H), 6.88 (*s*, 1H), 4.05 (*s*, 1H), 3.86 (*s*, 1H), 1.28 (*d*, 12H); ^{13}C NMR (126 MHz, CDCl_3) [ppm]: $\delta = 195.4$ (C=O), 154.8 (NC=O), 135.2, 134.5, 133.3, 129.0, 129.0, 128.9, 128.7, 128.7 (C_{Ph}), 77.7 (C benzylic), 46.8, 45.9 [$(\text{H}_3\text{C})_2\text{CH}-$], 21.6, 21.4 [$(\text{H}_3\text{C})_2\text{CH}-$].

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. All hydrogen atoms were placed in idealized positions ($\text{C—H} = 0.95\text{--}0.98$ Å) and refined using a riding model with isotropic displacement parameters calcu-

Refinement

Refinement on F^2
Least-squares matrix: full
 $R[F^2 > 2\sigma(F^2)] = 0.069$
 $wR(F^2) = 0.140$
 $S = 1.09$
8221 reflections
460 parameters
1 restraint
Primary atom site location: structure-invariant
direct methods
Secondary atom site location: difference Fourier
map

Hydrogen site location: inferred from
neighbouring sites
H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + 2.2197P]$
where $P = (F_o^2 + 2F_c^2)/3$
 $(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.27 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.25 \text{ e } \text{\AA}^{-3}$
Absolute structure: Twinning involves
inversion, so Flack parameter cannot be
determined

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refined as a two-component inversion twin.
