Received 8 September 2008; accepted 9 September 2008

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(C-C) = 0.008$ Å;
 R factor = 0.061; wR factor = 0.130; data-to-parameter ratio = 23.2.

In the molecule of the title compound, $[ZnCl_2(C_{11}H_{10}N_2)]$, the Zn^{II} atom is four-coordinated in a distorted tetrahedral configuration by two N atoms from the 6-methyl-2,2'-bipyridine ligand and by two Cl atoms. There are $\pi-\pi$ contacts between the pyridine ring and the five-membered ring, and also between the pyridine rings, [centroid–centroid distances = 3.685 (3) and 3.757 (3) Å, respectively].

Dichlorido(6-methyl-2,2'-bipyridine- κ^2 N,N')zinc(II)

R. Ahmadi, K. Kalateh, A. Ebadi, V. Amani and H. R. Khavasi

Comment

Recently, we reported the syntheses and crystal structures of $[Cd(5,5'-dmbpy)(\mu-Cl)_2]_n$, (II), (Ahmadi *et al.*, 2008) and $[Hg(4,4'-dmbpy)I_2]$, (III), (Yousefi *et al.*, 2008) [where 5,5'-dmbpy is 5,5'-dimethyl-2,2'-bipyridine and 4,4'-dmbpy is 4,4'-dimethyl-2,2'-bi-pyridine]. There are several Zn^{II} complexes, with formula, $[ZnCl_2(N-N)]$, such as $[ZnCl_2(bipy)]$, (IV), (Khan & Tuck, 1984), $[ZnCl_2(biim)]$, (V), (Gruia *et al.*, 2007), $[ZnCl_2(phbipy)]$, (VI), (Kozhevnikov *et al.*, 2006), $[ZnCl_2(phen)]$, (VII), (Reimann *et al.*, 1966), $[ZnCl_2(dmphen)]$, (VIII), (Preston & Kennard, 1969), $[ZnCl_2(dpmbip)]$, (IX), (Liu *et al.*, 2004), $[ZnCl_2(dm4bt)]$, (X), (Khavasi *et al.*, 2008) and $[Zn(5,5'-dmbpy)Cl_2]$, (XI), (Khalighi *et al.*, 2008) [where bipy is 2,2'-bipyridine, biim is 2,2'-biimidazole, phbipy is 5-phenyl-2,2'-bipyridine, phen is 1,10-phenanthroline, dmphen is 2,9-dimethyl-1,10-phenanthroline, dpmbip is 4,4'-diphenyl-6,6'-dimethyl-2,2'-bipyrimidine and dm4bt is 2,2'-dimethyl-4,4'-bithiazole] have been synthesized and characterized by single-crystal X-ray diffraction methods.

There are several Zn^{II} complexes, with formula, $[ZnCl_2L_2]$, such as $[ZnCl_2(py)_2]$, (XII), (Steffen & Palenik, 1976), $[ZnCl_2(4-cypy)_2]$, (XIII), (Steffen & Palenik, 1977), $[ZnCl_2(2-ampy)_2]$, (XIV), (Qin *et al.*, 1999) and $[ZnCl_2(im)_2]$, (XV), (Lundberg, 1966) [where py is pyridine, 4-cypy is 4-cyanopyridine, 2-ampy is 2-aminopyridine and im is imidazole] have been synthesized and characterized by single-crystal X-ray diffraction methods. We report herein the synthesis and crystal structure of the title compound, (I).

In the title compound, (I), (Fig. 1), the Zn^{II} atom is four-coordinated in a distorted tetrahedral configuration by two N atoms from 6-methyl-2,2'-bi-pyridine and two Cl atoms. The Zn-Cl and Zn-N bond lengths and angles (Table 1) are within normal ranges, as in (IV), (VII), (X) and (XI).

In the crystal structure, the $\pi-\pi$ contacts (Fig. 2) between the rings A (Zn1/N1/N2/C5/C6) and C (N2/C6-C10), and also between the pyridine rings B (N1/C1-C5) and C, Cg1 \cdots Cg3ⁱ and Cg2 \cdots Cg3ⁱⁱ [symmetry codes: (i) -x, -y, -z; (ii) 1 - x, -y, -z, where Cg1, Cg2 and Cg3 are the centroids of the rings A (Zn1/N1/N2/C5/C6), B (N1/C1-C5) and C (N2/C6-C10), respectively] may stabilize the structure, with centroid-centroid distances of 3.685 (3) Å and 3.757 (3) Å, respectively.

Experimental

For the preparation of the title compound, (I), a solution of 6-methyl-2,2' -bipyridine (0.15 g, 0.88 mmol) in methanol (10 ml) was added to a solution of ZnCl₂ (0.12 g, 0.88 mmol) in acetonitrile (30 ml) and the resulting colorless solution was stirred for 20 min at 313 K, and then it was left to evaporate slowly at room temperature. After one week, colorless block crystals of the title compound were isolated (yield; 0.19 g, 70.4%).

supplementary materials

Refinement

H atoms were positioned geometrically, with C-H = 0.93 and 0.96 Å for aromatic and methyl H, respectively, and constrained to ride on their parent atoms with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Figures

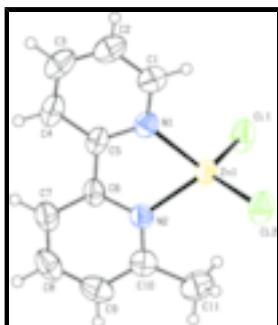

Fig. 1. The molecular structure of the title molecule, with the atom-numbering scheme. Displacement ellipsoids are drawn at the 40% probability level.

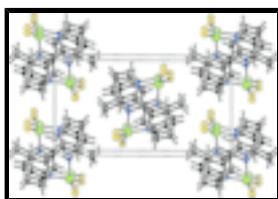

Fig. 2. A packing diagram of the title compound.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.060$	H-atom parameters constrained
$wR(F^2) = 0.130$	$w = 1/[\sigma^2(F_o^2) + (0.0315P)^2 + 1.9318P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.17$	$(\Delta/\sigma)_{\max} = 0.004$
3358 reflections	$\Delta\rho_{\max} = 1.05 \text{ e \AA}^{-3}$
145 parameters	$\Delta\rho_{\min} = -0.70 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
