Received 24 February 2014; accepted 19 March 2014

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; disorder in main residue; R factor = 0.022; wR factor = 0.058; data-to-parameter ratio = 13.0.

The title compound, $[\text{Dy}_4(\text{C}_7\text{H}_4\text{NO}_4)_{12}(\text{C}_{11}\text{H}_9\text{N}_5)_2]$ or $\text{Dy}_4(L1)_{12}(L2)_2$, where $L1 = 3$ -nitrobenzoic acid and $L2 = 2,6$ -bis(1*H*-pyrazol-1-yl)pyridine, is a linear tetranuclear complex possessing inversion symmetry. The two central inversion-related Dy^{III} atoms are seven-coordinate, DyO_7 , with a monocapped triangular-prismatic geometry. The outer two Dy^{III} atoms are eight-coordinate, DyO_5N_3 , with a bicapped triangular-prismatic geometry. The outer adjacent Dy^{III} atoms are bridged by three $L1^-$ carboxylate groups, while the inner inversion-related Dy^{III} atoms are bridged by four $L1^-$ carboxylate groups. The $L2$ ligands are terminally coordinated to the outer Dy^{III} atoms in a tridentate manner. In the crystal, molecules are linked via C–H \cdots O hydrogen bonds, forming a two-dimensional network parallel to (001). Two carboxylate O atoms, and N and O atoms of three nitro groups, are disordered over two positions, with a refined occupancy ratio of 0.552 (6):0.448 (6).

1. Comment

Single molecule magnets (SMMs) have potential applications in data storage, quantum information processing (Zheng *et al.*, 2008), magnetic refrigeration, and high-density information storage (Wu *et al.*, 2009). SMMs are mononuclear or multinuclear transition metal-based clusters or rare-earth metal-based clusters with no interactions between molecules. Mn^{II}-based SMMs were the first to be fully investigated, whereas recently 4f- or 5f-based compounds, especially Dy^{III}-based compounds, have been investigated because of their potential significant magnetic anisotropy and large energy barriers (Guo *et al.*, 2012). A number of multinuclear Dy-based compounds have been synthesized, for example, Dy₂ (Xu *et al.*, 2010), Dy₃ (Hussain *et al.*, 2009), Dy₄ (Abbas *et al.*, 2010), Dy₅ (Blagg *et al.*, 2011), and Dy₈ (Tian *et al.*, 2012). In line with our interest in designing multinuclear Dy-based compounds, we report herein on the synthesis and crystal structure of a new and novel linear tetrานuclear dysprosium compound, which is based on mixed N-donor and O-donor ligands.

The molecular structure of the title compound is illustrated in Fig. 1. It possesses inversion symmetry and the asymmetric unit is composed of two crystallographic independent Dy^{III} ions, six crystallographic independent 3-nitrobenzoate L1⁻ ligands, and one crystallographic independent 2,6-di(1*H*-pyrazol-1-yl)pyridine L2 ligand. The coordination spheres of the two Dy^{III} ion are different. Atom Dy1 has a DyO₅N₃ bi-capped triangular-prism geometry, completed by three nitrogen atoms (N1, N3, N5) from one L2 ligand, and five oxygen atoms (O1, O2, O5, O9, O13) from three L1⁻ ligands, where the capped atoms are N5, O9. Atom Dy2 has a DyO₇ monocapped triangular-prism geometry, created by seven oxygen atoms (O6, O10, O14, O17, O18, O21, O22) from seven L1⁻ ligands, where the capped atom is O10. The Dy—O/N bond length are in the normal range. The L2 ligand coordinates to the Dy1 atoms in a tridentate manner, whereas the L1⁻ ligands display two kinds of coordination mode, chelate and bidentate. The chelate mode involves the outer pair of Dy atoms, while the bidentate mode involves the inversion related Dy2 atoms in the center of the tetrานuclear complex.

The overall structure of the title compound is a tetrานuclear cluster in the Dy1—Dy2—Dy2A—Dy1A arrangement, see Figs. 1, 2, and 3. Atoms Dy1 and Dy2 are bridged by three L1⁻ carboxylate ligands with a metal-to-metal distance of 4.88 (2) Å. Through inversion symmetry the Dy1—Dy2 fragment connects to the symmetry-related Dy2A···Dy1A fragment *via* the Dy2—Dy2A connection linked by four L1⁻ carboxyl groups. The Dy2···Dy2A distance is 4.34 (2) Å. The span of this tetrานuclear cluster estimated by the distance of two terminal metal ions Dy1 and Dy1A is 14.07 (2) Å [symmetry code: A = -x, -y+1, -z].

In the crystal, molecules are linked via C-H···O hydrogen bonds forming a two-dimensional network parallel to (001); see Table 1 and Fig. 4.

Although the ligand 2,6-di(*1H*-pyrazol-1-*y*l) pyridine is extensively used to construct metal-organic compounds, it has rarely been used in combination with lanthanide ions, and there is no precedent of a cluster compound containing a lanthanide ion and the ligand 2,6-di(*1H*-pyrazol-1-*y*l)pyridine. The title compound is the first such compound to be synthesized and is a promising way to target multinuclear lanthanide clusters.

Moreover, in the literature, there is only one other report of a linear tetranuclear Dy^{III} complex (Lin *et al.*, 2012), [Dy₄(*L*)₂(C₆H₅COO)₁₂(MeOH)₄] (*L* = 2,6-bis((furan-2-ylmethylimino)methyl)-4-methyl-phenol), where the Dy^{III} sites are fully coordinated by O atoms, rather than being coordinated by both O and N atoms as observed in the title compound. Interestingly the metal-to-metal distances (4.24 (2) Å and 4.06 (2) Å) reported there are slightly shorter than those observed in the title compound.

2. Experimental

DyCl₃ (0.2 mmol), 2,6-di(*1H*-pyrazol-1-*y*l)pyridine (2 mmol), nitro benzoic acid (0.8 mmol), Na₂CO₃ (0.4 mmol) and H₂O (10 mL) were mixed together, then transferred into a 25 ml Teflon-lined reactor. This was heated at 483 K for 3 days. The mixture was then cooled to room temperature, at a rate of 3 K/h, and yielded block-like colourles crystals in a 58% yield based on Dy.

3. Refinement

The NH H atoms could be located in a difference Fourier map. The C and N-bound H atoms were included in calculated positions and treated as riding: N—H = 0.86 Å, C—H = 0.93 – 0.97 Å with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N/C})$. Two O atoms of carboxyl groups (O10/O10' and O14/O14') and atoms in three nitro groups

(N10/N10', O19/O19', O20/O20', N11/N11', O23/O23', O24/O24' and O16/O16') are disordered over two positions with a refined occupancy ratio of 0.448 (6):0.552 (6).

 $\Delta\rho_{\text{min}} = -0.67 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
