Key indicators: single-crystal X-ray study;  $T = 173\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.015\text{ \AA}$ ;  
 $R$  factor = 0.077;  $wR$  factor = 0.204; data-to-parameter ratio = 8.3.

The title compound,  $[\text{Li}_4\text{O}_4(\text{C}_{12}\text{H}_8\text{BO})_4(\text{C}_4\text{H}_{10}\text{O})_4]$ , features a  $\text{Li}_4\text{O}_4$  cube. Each Li atom in the cube is additionally coordinated by a diethyl ether molecule and each O atom in the cube carries a 9-oxa-10-boraanthracene residue. The crystal studied was a non-merohedral twin [twin law  $(-1\ 0\ 0\ / 0\ 0\ 1\ / 0\ 1\ 0)$ ; the contribution of the major twin component refined to 0.553 (3)] emulating apparent tetragonal symmetry, whereas the actual crystal system is just orthorhombic.

### Comment

In this study, the accordance of the structural characteristics between the alkali metal salts of borinic acids,  $M^+[EBR_2]^-$  ( $E = O$ ), and the related silyl chalcogenolates  $M^+[ESiR_3]^-$  ( $E = O, S, Se, Te$ ) is taken into account. It has been shown that chalcogenolate ligands of the type  $[ESiR_3]^-$  ( $E = O, S, Se, Te$ ) were used to stabilize transition metal centers (Wolczanski, 2009; Kückmann *et al.*, 2005, 2008, and 2010). These ligands have also been applied in the field of macromolecular chemistry. Normally, transition metal complexes possess 6 e<sup>-</sup> chalcogenolate ligands in a  $\mu_3$  binding mode. Recently, however, we have shown that the anion of the mixed valence Mn(I/II) complex  $[Na(thf)_6][(OC)_3Mn(\mu-SSiBu_3)_3MnSSiBu_3]$  contains a terminal thiolate ligand with a linear Mn—S—Si unit (Kückmann *et al.*, 2008). The prerequisite for electronic communication between the metal center and the ligand is thus fulfilled. By an attempt to synthesize compound **III** (Fig. 1) we obtained as a by-product single crystals of the title compound (**IV**). The starting materials **I** and **II** were synthesized by modification of the procedures reported in the literature (Mikoshiba *et al.*, 2003; Davidson & French, 1960; Zuideveld *et al.*, 2002). **IV** displays a heterocubane structure in the solid state. Related structural motifs are found in the silyl chalcogenolates ( $Na[OSiBu_3]_4$ ,  $(Na[OSiPh/Bu_2])_4$ , and  $([Na(thf)][OSiMePh_2])_4$  (Lerner *et al.* 2002; Kückmann *et al.*, 2007). In conclusion, the solid-state structure of **IV** provides further evidence for the diagonal relationship between B and Si.

The title compound (Fig. 2) features a  $Li_4O_4$  cube. Each Li atom in the cube is additionally coordinated by a diethyl ether molecule and each O atom in the cube carries a 9-oxa-10-bora-anthryl residue.

### Experimental

All transformations were carried out under an atmosphere of dry nitrogen using standard Schlenk techniques and carefully dried solvents. The <sup>11</sup>B NMR spectrum was recorded on a Bruker Avance 300. The borinic acid **II** (1.18 g, 6.0 mmol) was dissolved in Et<sub>2</sub>O (40 ml) and cooled to 0 °C. Under vigorous stirring a solution of Li[AlH<sub>4</sub>] (9 mmol) in Et<sub>2</sub>O (19 mL) was added dropwise over a period of 30 min (beforehand, few small crystallites of 2,2'-biquinoline had been added to the ethereal Li[AlH<sub>4</sub>] solution as a color indicator for the consumption of Li[AlH<sub>4</sub>]). The mixture was allowed to warm to room temperature over night yielding a pale yellow suspension. In the <sup>11</sup>B NMR spectrum (in C<sub>6</sub>D<sub>6</sub>/THF (1:1), referenced to external BF<sub>3</sub>·Et<sub>2</sub>O) a triplet was observed at -24.0 ppm (<sup>1</sup>J<sub>BH</sub> = 78 Hz) which indicated conversion into the putative 9,9-dihydrido-9-oxa-10-borataanthracene (**III**) (*cf.* lithium 9,9-dihydrido-9-boratafluorene: δ(<sup>11</sup>B) = -22.3 (<sup>1</sup>J<sub>BH</sub> = 77 Hz) in CDCl<sub>3</sub>) (Knizek & Nöth, 2000). The solid was removed by filtration. The clear solution was subject to a crystallization experiment implementing gas phase diffusion exchange of solvent with a reservoir containing a mixture of hexane/pentane (15 ml/15 ml). After three weeks a few cubic crystals of the title compound (**IV**) were obtained.

## Refinement

Due to the absence of anomalous scatterers, the absolute structure could not be determined and 6701 Friedel pairs were merged. All H atoms were geometrically positioned and refined using a riding model with fixed individual displacement parameters [ $U(H) = 1.2 U_{\text{eq}}(\text{C})$  or  $U(H) = 1.5 U_{\text{eq}}(\text{Cmethyl})$ ] using a riding model with C—H ranging from 0.95 Å to 0.99 Å. The C—C distances in the ether molecules were restrained to be equal within an effective e.s.d. of 0.01 Å. The crystal was a non-merohedral twin emulating apparent tetragonal symmetry. The  $b$  and  $c$  axis are of very similar lengths. The twin law is (-1 0 0 / 0 0 1 / 0 1 0) and the contribution of the major twin component refined to 0.553 (3).

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
