Received 24 March 2014; accepted 2 April 2014

Key indicators: single-crystal X-ray study;  $T = 298$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  $R$  factor = 0.035;  $wR$  factor = 0.088; data-to-parameter ratio = 19.2.

The title compound,  $\text{C}_{12}\text{H}_6\text{Cl}_4\text{S}_2$ , features an S—S bond [2.0252 (8) Å] that bridges two 2,3-dichlorophenyl rings with a C—S—S—C torsion angle of 88.35 (11)°. The benzene rings are normal one to the other with a dihedral angle of 89.83 (11)°. The crystal structure features intermolecular  $\text{Cl}\cdots\text{Cl}$  [3.4763 (11) Å] and  $\pi$ — $\pi$  stacking interactions [centroid—centroid distances = 3.696 (1) and 3.641 (2) Å]. Intramolecular C—H $\cdots$ S interactions are also observed.

**Bis(2,3-dichlorophenyl) disulfide**

**Rebeca Nayely Osorio-Yáñez, Carmela Crisóstomo-Lucas, Ericka Santacruz-Juárez, Reyna Reyes-Martínez and David Morales-Morales**

**1. Introduction**

The disulfide bonds are found in proteins (Sevier and Kaiser, 2006), natural products and pharmacologically active compounds. Disulfide compounds have shown to exhibit activity as fungicide, mildew-proofing (Crowley, 1964) and antitumor agents (Hashash *et al.*, 2002). In organic synthesis disulfides are used in cross-coupling reactions catalyzed by transition metal compounds such as palladium, nickel and copper (Gomez-Benitez *et al.*, 2006; Yu *et al.*, 2010).

Several methods for the synthesis of disulfides have been reported. These processes involve the oxidative coupling of mercaptans by various oxidants such as molecular oxygen, nitric oxide, solvent-free permanganate, metal ions and promoted by sulfonyl chloride in aqueous media (Xiao *et al.*, 2009; Shaabani *et al.*, 2008; Ogilby, 2010).

Thus, in this report we present the crystal structure of the bis(2,3-dichlorophenyl)disulfide obtained by a nucleophilic substitution reaction. The structure is represented in figure 1.

**2. Experimental****2.1. Synthesis and crystallization**

The title compound was obtained as a by-product of the reaction between 2-(chloromethyl)benzimidazole (0.2 g) and the lead salt of 2,3-dichlorobenzethiol ( $[\text{Pb}(\text{SC}_6\text{H}_3\text{-2,3-Cl}_2)_2]$ ) (0.337 g) in toluene. The resulting reaction mixture was allowed to proceed under reflux by 8 h after which time the formation of  $\text{PbCl}_2$  was observed indicating completion of the reaction. The reaction mixture was then filtered through a short Celite plug to afford a colorless solution, the solvent was evaporated under vacuum and the residue column chromatographed (silica gel 60, eluted with 3/2 ethyl acetate/hexane system). Slow Evaporation of the first fraction collected produced crystals of the title compound suitable for X-ray diffraction analysis.

**2.2. Refinement**

Crystal data, data collection and structure refinement details are summarized in Table 1.

H atoms were included in calculated positions ( $\text{C-H} = 0.93 \text{ \AA}$  for aromatic H) and refined using a riding model with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}$  of the carrier atoms.

In the refinement six reflections, (2 0 0), (0 1 3), (0 0 1), (-2 1 2), (2 -4 3) and (-1 0 1), were considered as disagreeable and were omitted.

**3. Results and discussion**

The asymmetric unit of the title compound consists of one molecule on the disulfide. The rings of the bis(2,3-dichlorophenyl)disulfide show a dihedral angle of  $89.83^\circ$  between the two planes and a torsion angle  $\text{C1-S1-S2-C7}$  of  $88.35 (11)^\circ$ . The value of the  $\text{C-S-S-C}$  torsion angle is similar to those found in similar compounds, such as bis-

(pentachlorophenyl)disulfide (Deng *et al.*, 2003), diphenyldisulfide (Korp & Bernal, 1984) and bis(4-amino-2-chlorophenyl)disulfide (Tang *et al.*, 2011). The S—S distance is 2.0252 (8) Å, whereas the C—S distances are 1.784 (2) and 1.7835 (19) Å. These values are similar and close in value to compounds such as bis(pentachlorophenyl)disulfide with a S—S distance of 2.063 (2) Å and bis(4-amino-2-chlorophenyl)disulfide of 2.0671 (16) Å. The crystal packing is stabilized by  $\pi$ - $\pi$  and Cl $\cdots$ Cl interactions (Figure 2). The  $\pi$ - $\pi$  interactions of the 2,3-dichlorophenyl rings presents distances between centroids of 3.696 (1) and 3.641 (2) Å. The Cl1 $\cdots$ Cl2 contact distance is of 3.476 Å that is close to the sum of the van der Waals radii of the chloride atoms (Bondi, 1964). The sulphur atoms present C—H $\cdots$ S intramolecular interactions, these values are in the table 1.

**Figure 1**

Detector resolution: $8.333 \text{ pixels mm}^{-1}$	$R_{\text{int}} = 0.023$
$\omega$ scans	$\theta_{\text{max}} = 27.5^\circ$ , $\theta_{\text{min}} = 2.9^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 2008)	$h = -9 \rightarrow 9$
$T_{\text{min}} = 0.678$ , $T_{\text{max}} = 0.862$	$k = -10 \rightarrow 10$
	$l = -16 \rightarrow 16$

*Refinement*

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.035$	H-atom parameters constrained
$wR(F^2) = 0.088$	$w = 1/[\sigma^2(F_o^2) + (0.0397P)^2 + 0.1749P]$
$S = 1.03$	where $P = (F_o^2 + 2F_c^2)/3$
3130 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
163 parameters	$\Delta\rho_{\text{max}} = 0.41 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.30 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
