Supplemental Information

Perturbed Redox Signaling

Exacerbates a Mitochondrial Myopathy

Sukru Anil Dogan, Raffaele Cerutti, Cristiane Benincá, Gloria Brea-Calvo, Howard Trevor Jacobs, Massimo Zeviani, Marten Szibor, and Carlo Viscomi

Figure S1. Related to Figure 1. KO-AOX is phenotypically worse than KO and control mice.

(A) Weight curve for male WT, AOX, KO and KO-AOX mice. Asterisks are used to compare the weight between KO and KO-AOX; the hash keys between WT and KO (n = 13-19). **(B)** Percentage of body fat in 8-week-old animals measured by NMR (n = 4).

Bars represent mean \pm S.E.M. Asterisks and hash keys over the bars indicate statistical significance vs. WT; over the brackets among indicated groups. (*p, #p \leq 0.05; **p \leq 0.01; ***p, ###p \leq 0.001; ****p $<$ 0.0001; unpaired Student's *t*-test).

A

B

Figure S2. Related to Figure 2. SDH activity is increased in KO muscles but returns to WT levels in KO-AOX.

(A) Representative gastrocnemius muscle SDH activity micrograph. Whole muscle fiber was stained for SDH activity in 8-week-old WT, AOX, KO and KO-AOX animals (blue). The image represents a randomly chosen image from four samples. Scale bar: 500 μm . **(B)** Quantification of relative SDH intensity (% of total area) (n = 4).

Bars represent mean \pm S.E.M. Asterisks over the bars indicate statistical significance vs. WT; over the brackets among indicated groups. (* $p \leq 0.05$; *** $p \leq 0.001$; unpaired Student's *t*-test).

Figure S3. Related to Figure 3. No differences were observed in the distribution of muscle fiber types among WT, AOX, KO and KO-AOX animals.

(A) Sections of 8-week-old gastrocnemius muscle were immunostained for the different MHCI, MHCIIA and MHCIIIB myosins. Type I (Red), type IIA (Blue), type IIB (Green) and type IIX (unstained) fibers are shown in a whole tissue 3D montage. Scale bars: WT and KO 500 μm , AOX 400 μm and KO-AOX 300 μm . White rectangle highlights the zoomed area (scale bar: 50 μm). **(B)** Quantification of percentage of each fiber per whole tissue section ($n = 4$).

Bars represent mean \pm S.E.M.

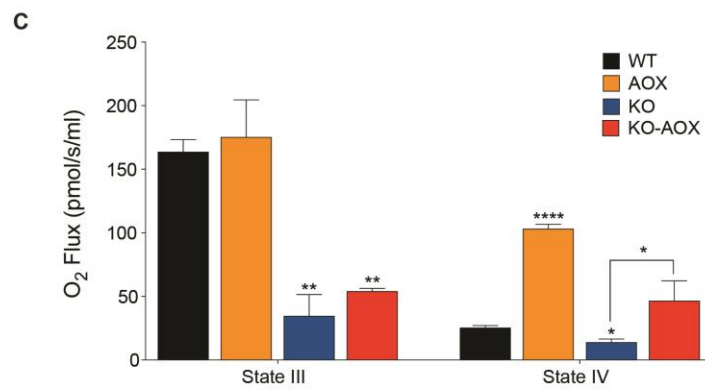

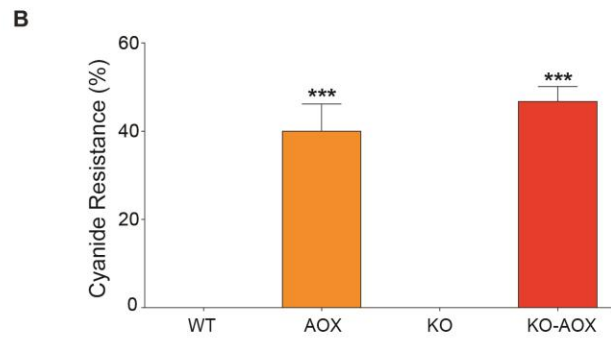

Figure S4. Related to Figure 4. AOX is expressed and active in KO-AOX.

(A) Western blot analysis of AOX in skeletal muscle, brain (Br), heart (He) and liver (Li) of WT, AOX and KO-AOX mice. GAPDH is used as loading control. (B) Cyanide resistance in AOX and KO-AOX mice measured by percent of State III (ADP-stimulated) respiration (n=4). (C) Succinate-driven State III (ADP-stimulated) and State IV (oligomycin-sensitive) oxygen consumption rates in isolated skeletal muscle mitochondria (n = 4).

All experiments were done on 8-week-old animals. Bars represent mean \pm S.E.M. Asterisks directly on top indicate level of statistical significance compared to WT (*p \leq 0.05; **p \leq 0.01; ***p \leq 0.001; ****p < 0.0001; unpaired Student's *t*-test).

Figure S5. Related to Figure 6. Both KO and KO-AOX show increased levels of EIF-2alpha (EIF2 α) and decreased mTOR signaling.

Western blots of **(A)** phosphorylated- and total EIF4EBP1; and **(B)** phosphorylated- and total EIF2 α . **(C)** Quantification (n = 5) of aforementioned proteins in WT, AOX, KO and KO-AOX mice.

Western blots were performed on skeletal muscle homogenates of 8-week-old mice. GAPDH is used as loading control. Bars represent mean \pm S.E.M. Asterisks over the bars indicate statistical significance vs. WT; over the brackets among indicated groups. (*p \leq 0.05; **p \leq 0.01; unpaired Student's *t*-test).

Table S1. Related to Star Methods. qPCR primer sequences.
