

Knowledge, Attitude and Practices Toward Breast Cancer

Sir,

The recent publication on “Knowledge, attitude and practices (KAP) toward breast cancer” is very interesting.^[1] Azubuike *et al.* concluded that “while a substantial number still remains ignorant of breast cancer issues, a good number of those who have knowledge were yet to translate knowledge and attitudes into practice.^[1]” This is a classical report on KAP study. It is no doubt that the ones who have good knowledge will consequently practice in a good way. Nafissi *et al.* noted that “community awareness and education level are important elements” determined the desired practice.^[2] Doshi *et al.* proposed that “educational programs to create awareness regarding regular breast cancer screening behavior” is needed.^[3] In fact, additional important concern is on the correctness of the practice. The routine practice should be checked whether it is correctly performed or not. Practice in the incorrect way might be useless and waste of time.
