 Article Recommendations

The authors retract the article due to a misleading conclusion from this published article. During the follow-up tests, it was observed that the results of the Morris Water Maze and biochemical parameters described in Figures 1, 2, 5, and 6 were not reproducible. Correction of data in these figures is not possible because the relevant samples are no longer available to the authors. Additionally, the authors have agreed that such actions potentially provide misleading conclusions and analysis of experiments, raising significant doubts about the main findings of the work. As such, the article is being retracted.

The original article was published on July 6, 2023, and retracted on March 21, 2024.
