## Crystal structure of aqua(perchlorato)bis[ $\mu$ -(E)-2-({[2-(pyridin-2-yl)ethyl]imino}methyl)phenolato- $\kappa^4 N,N',O:O$ ]dicopper(II) perchlorate

Ugochukwu Okeke, Yilma Gultneh and Ray J. Butcher\*

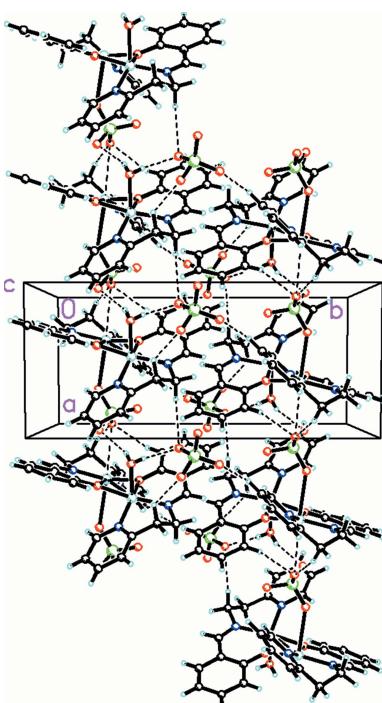

Department of Chemistry, Howard University, 525 College Street NW, Washington, DC 20059, USA. \*Correspondence e-mail: rbutcher99@yahoo.com

The title compound,  $[Cu_2(ClO_4)(C_{14}H_{13}N_2O)_2(H_2O)]ClO_4$ , crystallizes as an unsymmetrical dinuclear cation bridged by the phenoxy O atoms with one  $Cu^{II}$  atom coordinated by a water molecule and the other by a perchlorate anion, thus making both  $Cu^{II}$  atoms five-coordinate, and with a further perchlorate anion present for charge balance. A long interaction [2.9893 (5) Å] between one of the two  $Cu^{II}$  atoms and an O atom of the perchlorate counter-ion links the cations and anions into linear chains along the *a*-axis direction. In addition, the water H atoms link with the perchlorate counter-ion. These interactions, along with numerous C–H···O interactions between the tetrahedral perchlorate anions, link the ions into a complex three-dimensional array. One of the perchlorate anions is disordered over two conformations with occupancies of 0.586 (4) and 0.414 (4).

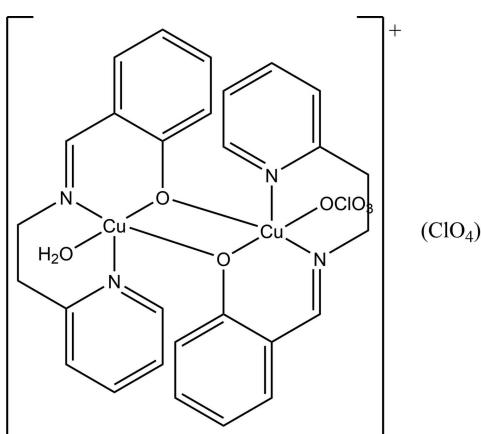

### 1. Chemical context

Proteins containing dinuclear copper centers play important roles in biology, including dioxygen transport or activation, electron transfer, reduction of nitrogen oxides and hydrolytic chemistry (Karlin & Tyeklar, 1993; Torelli *et al.*, 2000; Poater *et al.*, 2008; Utz *et al.*, 2003). The catalytic properties of some dicopper complexes have also been observed in some recent studies (Jagoda *et al.*, 2005). The crystal engineering of self-assembled supramolecular architectures is currently of great interest, owing to their intriguing topologies and their applications in materials chemistry, in particular in optoelectronics, conductivity and superconductivity, charge-transfer and magnetism, nanoporous materials and biomimetic materials (Robson, 1996; Blake *et al.*, 1999; Sauvage, 1999).

Compounds of transition metal complexes comprising the ({[2-(pyridin-2-yl)ethyl]imino}methyl)phenol ligand have been synthesized for various processes (Egekenze *et al.*, 2017; Sanyal *et al.*, 2014; Chakraborty *et al.*, 2013; Tandon *et al.*, 1994, 2000; Latour *et al.*, 1989). Complexes of the tridentate ligand have been used as biomimics in the catalysis of hydrolysis of phosphate esters and as catalysts for catechol oxidation (Egekenze *et al.*, 2017). Pyrazole and pyridine are nitrogen donors that are commonly used as ligands to mimic metalloenzymes. These heterocyclic groups are widely used to form inorganic complexes because they have  $pK_a$  values similar to those present in the hystidyl functional group of many enzymes. As part of an ongoing effort to synthesize complexes to use as biomimetics, the title copper(II) complex has been synthesized. In view of the interest in these types of metal complexes, its structure has been determined.

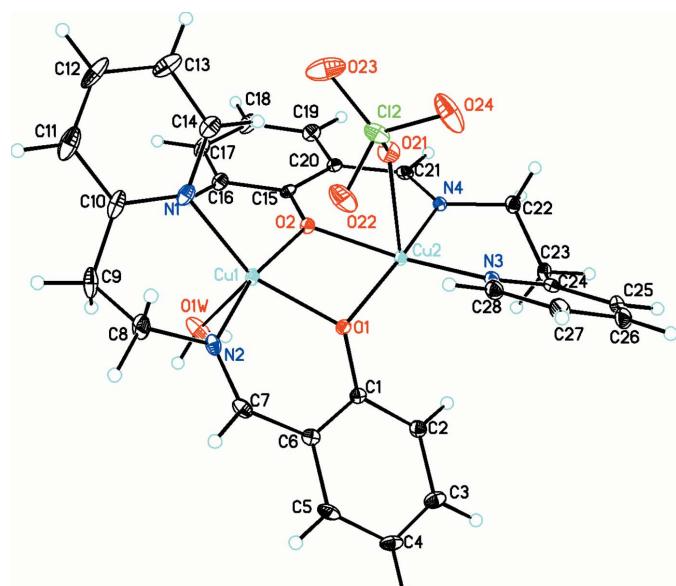

OPEN ACCESS

## 2. Structural commentary

The title compound crystallizes in the monoclinic space group  $P2_1/c$  as an unsymmetrical dinuclear cation bridged by the phenoxy O atoms with one Cu<sup>II</sup> atom coordinated by a water molecule and the other by a perchlorate anion, thus making both Cu<sup>II</sup> atoms five-coordinate, and with a further perchlorate anion present for charge balance (see Fig. 1). The Cu $\cdots$ Cu distance in the dinuclear unit is 3.0225 (5) Å. There are previously reported dinuclear structures involving the {[2-(pyridin-2-yl)ethyl]imino}methylphenolato ligand as a bridging ligand with other metals (Chakraborty *et al.*, 2013) and one instance involving copper (Yin *et al.*, 1998) where the structure is very similar apart from the fact that the bond between the Cu atom and the ClO<sub>4</sub><sup>–</sup> counter-ion is not indicated. There is very little information available for this

**Figure 1**

Diagram of the Cu-containing dinuclear cation showing the atom labeling. The non-coordinated anion is omitted for clarity. Displacement parameters are drawn at the 30% probability level.

structure apart from a line drawing in the Cambridge Structural Database (Groom *et al.*, 2016).

In the title structure (Fig. 1), since both Cu atoms are five-coordinate, the  $\tau$  parameter (Addison *et al.*, 1984) for Cu1 is 0.21 while that for Cu2 is 0.045, indicating that Cu1 is more distorted from a square-pyramidal geometry than Cu2. The Cu–O bond lengths (Table 1) for Cu1 and Cu2 are 1.9469 (18), 2.0204 (17) Å and 1.9375 (18), 1.9545 (17) Å, respectively, while the Cu–N<sub>imine</sub> and Cu–N<sub>py</sub> bond lengths are 1.959 (2), 1.940 (2) Å and 1.996 (2), 1.987 (2) Å, respectively, with the bonds involving the imine group being shorter than those to pyridine as is generally found. The Cu1–OH<sub>2</sub> and Cu2–OCLO<sub>4</sub> apical bonds are longer at 2.248 (2) and 2.6101 (18) Å, respectively.

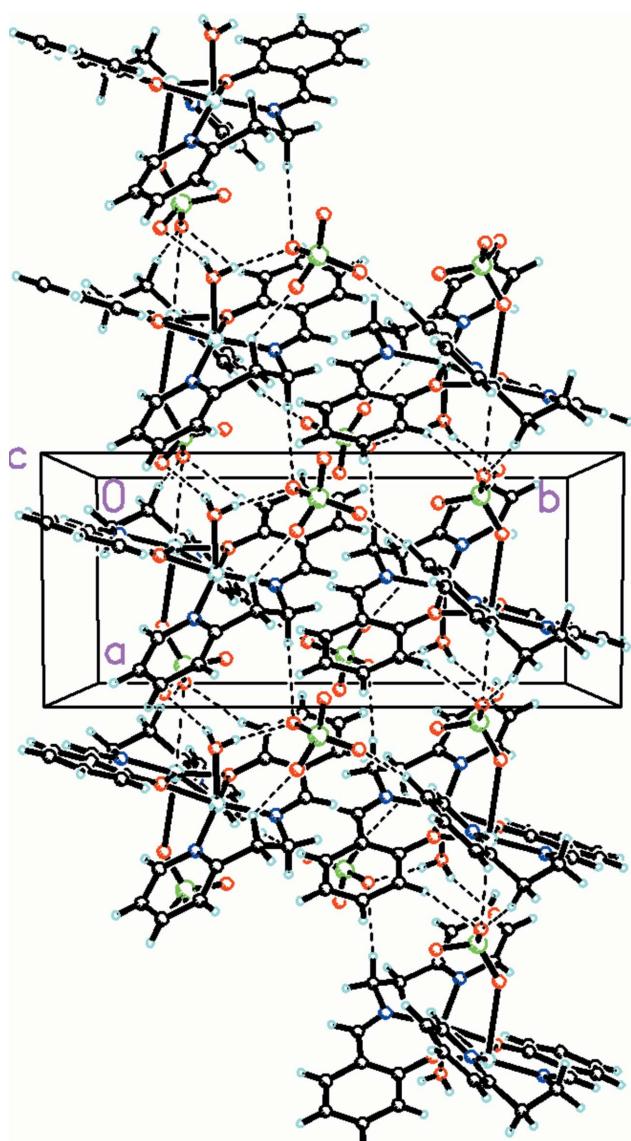

The copper atoms are displaced from their basal coordination planes, O1, O2, N1, N2 (r.m.s. deviation = 0.186 Å) for Cu1, and O1, O2, N3, N4 (r.m.s. deviation = 0.252 Å) for Cu2, towards the apical ligands by 0.218 (1) and 0.037 (1) Å, respectively. The dihedral angle between these two planes is 39.31 (5)°. Thus the whole dinuclear complex adopts a saddle shape similar to that observed in metalloporphyrin structures (Kuzuhara *et al.*, 2016) with the two phenyl rings and two pyridine rings on opposite sides of the central Cu<sub>2</sub>O<sub>2</sub> bridging group. The magnitude of this distortion can be seen from the dihedral angles between the two phenyl [41.45 (7)°] and the two pyridine rings [76.75 (7)°].

### 3. Supramolecular features

In addition to the bonds involving the copper atom mentioned above, there is a longer interaction [2.9893 (5) Å] between Cu<sup>2+</sup> and O<sup>2-</sup> of an adjoining unit (at  $x + 1, y, z$ ), which links the cations into linear chains along the *a*-axis direction (see Fig. 2). In addition, the water H atoms link with the perchlorate counter-ion. These interactions, along with numerous C—H···O interactions (Table 2) between the tetrahedral perchlorate anions link into a complex three-dimensional array.

### 4. Database survey

A survey of the Cambridge Structural Database (Version 5.38; Groom *et al.*, 2016) for similar dinuclear structures of related

**Figure 2**

Packing diagram viewed along the *c* axis showing the extensive C—H···O and Cu···O interactions (dashed lines) linking the cations and anions into a complex three-dimensional array. Only the major occupancy conformations of the disordered anions are shown.

Schiff base ligands and involving both coordinated perchlorate and water molecules resulted in seven hits [COSHOU (Anbu *et al.*, 2009), EFUJAS (da Rocha *et al.*, 2014), EFUJEW (da Rocha *et al.*, 2014), JAVTOP (Mandal *et al.*, 1989), JAVTOP01 (Cheng *et al.*, 2012), WOGVAR (Cheng *et al.*, 2014), and WUKPAU (Hazra *et al.*, 2009)]. However, in all cases the ligands involved were tetradeinate Schiff base macrocycles rather than tridentate Schiff base ligands. Thus there is no directly related example.

### 5. Synthesis and crystallization

2-(2-Pyridyl)ethylamine (0.3918 g, 3.207 mmol) was dissolved in methanol. Salicylaldehyde (0.3916 g, 3.207 mmol) was dissolved in methanol and stirred overnight. Cu(ClO<sub>4</sub>)<sub>2</sub>·6H<sub>2</sub>O (4.811 g, 1.783 mmol) was dissolved in the methanol solution. The mixture was stirred at room temperature overnight. The methanol was removed by rotary evaporation. The product was crystallized by dissolving it in acetonitrile and layering the solution with diethyl ether. The green crystals formed were allowed to grow overnight before gravity filtering, air drying, and collection of the crystallized product.

### 6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. The H atoms were positioned geometrically and allowed to ride on their parent atoms, with C—H = 0.95–0.99 Å and N—H = 1.00 Å and with  $U_{\text{iso}}(\text{H}) = xU_{\text{eq}}(\text{C})$ , where  $x = 1.5$  for methyl H atoms and 1.2 for all other C-bound H atoms. The hydrogen atoms attached to water were refined isotropically. One of the perchlorate anions is disordered over two conformations with occupancies of 0.586 (4) and 0.414 (4) and were constrained to have similar thermal and metrical parameters.

### Funding information

RJB is grateful for the NSF award 1205608, Partnership for Reduced Dimensional Materials for partial funding of this research as well as the Howard University Nanoscience Facility access to liquid nitrogen. RJB acknowledges the NSF MRI program (grant No. CHE-0619278) for funds to purchase an X-ray diffractometer.

*Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
