Pedobacter schmidteae sp. nov., a new bacterium isolated from the microbiota of the planarian *Schmidtea mediterranea*

Luis Johnson Kangale^{1,2}, Didier Raoult^{2,3,4,5}, Eric Ghigo^{2,1,5*} & Pierre-Edouard Fournier^{1,2,5*}

Pedobacter schmidteae sp. nov. strain EG^T (Collection de Souches de l'Unité des Rickettsies CSUR P6417 = Colección Española de Cultivos Tipo CECT 9771) is a new *Pedobacter* species isolated from the planarian *Schmidtea mediterranea*. *Schmidtea mediterranea* are flatworms living in freshwater and exhibiting an unusual ability to regenerate amputated parts. To date, the gut microbiota of *Schmidtea mediterranea* remains poorly studied. Here, via the culturomics strategy that consists in using diversified culture conditions, we isolated a new bacterium, strain EG, that we characterized using the taxono-genomics approach that combines phenotypic assays and genome sequencing and analysis. Strain EG exhibits a 16S rRNA sequence similarity of 98.29% with *Pedobacter nyackensis* strain NWG-1114^T, its closest neighbour with standing in nomenclature. It is an aerobic bacterium belonging to the family *Sphingobacteriaceae*. Colonies are small, round, smooth and transparent. Bacterial cells are Gram-negative, rod-shaped, motile and non-spore-forming bacilli with positive catalase and oxidase activities. The genome sequence is 6,198,518 bp-long with a G + C content of 41.13%, and the OrthoANI and dDDH values when compared to *P. nyackensis* are 77.34% and 21.50%, respectively. Strain EG^T exhibits unique characteristics that classify it as the type strain of new bacterial species for which we propose the name *Pedobacter schmidteae* sp. nov.

Schmidtea mediterranea is an invertebrate living in environmental water. This flatworm is used as a model of development, because of its extraordinary ability to regenerate after amputation, because of his high contents in stem cells known as neoblasts¹. It has been shown that *S. mediterranea* is an excellent model to investigate host-pathogen relationships^{2,3}, notably in the context of human pathogens. To date, the gut microbiota of *S. mediterranea* remains poorly studied^{4,5}. Using the microbial culturomics approach⁶, we investigated the *S. mediterranea* microbiota. Culturomics is a concept in which diversified culture conditions are used to enable isolation of a maximum of bacterial species from the human microbiota⁷⁻¹⁰. During this analysis, we isolated a bacterial strain from *S. mediterranea* that could not be identified using Matrix Assisted Laser Desorption-Ionisation Time of Flight-Mass Spectrometry (MALDI-TOF-MS). We used the taxono-genomics strategy that combines phenotypic assays and genome sequencing to further characterize this bacterium¹¹⁻¹⁴. This enabled us to describe a new bacterial strain that exhibited enough genetic and phenotypic differences with closely related bacteria. We propose it as a new species named *Pedobacter schmidteae* sp. nov.

Materials and Methods

Culture of *Schmidtea mediterranea*. *Schmidtea mediterranea* asexual clonal line CIW4² is a laboratory planarian strain that has been preserved in our laboratory for the past 10 years, by cutting animals in tree fragments each month. *S. mediterranea* were kept in the dark, in filtered tap water, at 19°C without antibiotics. The animals were fed once per week with homogenized calf liver and were starved for at least two weeks prior to studying them. Filtered water was obtained using a device consisting of two 0.2 µm filters, one containing charcoal and ceramics (Fairey Industrial Ceramics limited, England), and the other being a 0.20 µm membrane (Thermo

¹Aix-Marseille Univ, IRD, AP-HM, SSA, VITROME, Marseille, France. ²IHU-Méditerranée-Infection, Marseille, France.

Scientific Nalgene filtration Products, Mexico). Filtered water was checked for sterility prior to be used for planarian culture.

Isolation and identification of bacteria from *Schmidtea mediterranea*. Following two weeks of starvation, *S. mediterranea* were washed in filter-sterilized water and then one ground worm was inoculated in Buffered Charcoal Yeast Extract (BCYE) (Oxoid Deutschland GmbH, Wesel, Germany), Luria Bertani (LB) and 5% sheep blood-enriched Columbia agar (bioMérieux, Marcy l'étoile, France). All inoculated media were incubated at 19, 28 and 37 °C. Each individual bacterial colony was harvested and identified by MALDI-TOF-MS (Microflex spectrometer; Bruker Daltonics, Bremen, Germany)¹⁵. The obtained spectra were imported into the MALDI Biotyper 3.0 software (Bruker Daltonics) and analysed against the reference spectra of bacteria included in the database (Bruker database constantly updated with the Mediterranean-Infection database (<http://www.mediterranee-infection.com/article.php?larub=280&titre=urms-database>)). The MALDI Biotyper RTC software was used to interpret the results according to the obtained score values: a colony was likely identified at the species level for a score ≥ 2.0 , probably identified for a score between 1.99 and 1.7, but not identified for a score < 1.7 .

Phylogenetic analysis. Bacterial colonies that were not identified at the species level using MALDI-TOF MS were further tested using 16S rRNA sequencing. Genomic DNA was extracted using an EZ1 automate and the DNA tissue kit (Qiagen, Hilden, Germany). The complete 16S rRNA gene amplification and sequencing was performed using eight primers on an ABI Prism 3130xl Genetic Analyzer capillary sequencer (Applied Bio systems, Bedford, MA, USA). The primers used were Fd1 (5'-AGAGTTTGATCCTGGCTCAG-3'), Rp2 (5'-ACGGCTACCTGTTACGACTT-3'), F536 (5'-CAGCAGCCGCGGTAATAC-3'), R536 (5'-GTATTACCGCGGCTGCTG-3'), F800 (5'-ATTAGATACCCTGGTAG-3'), R800 (5'-CTACCAGGGTATCTAAT-3'), F1050 (5'-TGTCGTCAGCTCGTG-3') and R1050 (5'-CACGAGCTGACGACA-3') (Eurogentec, Angers, France). The CodonCode Aligner software was used for sequence alignment, assembly and correction (<https://www.codoncode.com/>). For taxonomic assignment, a BLASTn search was performed against the nr database¹⁶. A sequence similarity threshold of 98.65% by comparison with the phylogenetically closest species with standing in nomenclature was used to delineate a putative new species¹⁷. Phylogenetic relationships were inferred from the comparison of 16S rRNA sequences using the MEGA7 software¹⁸.

Phenotypic, biochemical and chemical characteristics of strain EG. Culture of strain *strain* EG and *P. nyackensis* strain NWG-II14^T (DSM19625) was attempted at various growth temperatures (6, 19, 30, 37 and 45 °C) in 5% sheep blood-enriched Columbia agar (bioMérieux) under anaerobic, aerobic and microaerophilic atmospheres using GasPak™ EZ generators (Becton- Dickinson, Maryland, USA). Sporulation was tested by thermal shock, which consists in exposing bacteria to a temperature of 80 °C for 30 minutes and then monitoring their growth for 4 days. Various salinity (0, 8.5, 25, 50, 100 and 200 g/l) and pH (4, 5.5, 6, 7.5, 8, 9 and 10) conditions were tested. Gram staining and motility from fresh colonies were observed using a DM1000 photonic microscope (Leica Microsystems, Nanterre, France) with a 40 × objective lens. Catalase and oxidase activities were tested by using a BBL DrySlide according to the manufacturer's instructions (Becton Dickinson, Le Pont de Claix, France). The size of bacterial cells was measured using transmission electron microscopy. API strips (API ZYM^{19–21}, API 20NE^{22,23}, API 20E^{24,25} and API 50CH^{26–29}, bioMérieux) were used to study the biochemical characteristics of the strains. Bacterial susceptibility to benzylpenicillin, amoxicillin, ampicillin, ceftriaxone, imipenem, ciprofloxacin, amikacin, gentamicin, streptomycin, daptomycin, doxycycline, metronidazole, rifampicin, and vancomycin was assessed using E-tests and a 0.5 McFarland concentration of strains EG and NWG-II14^T. Cellular fatty acid methyl ester (FAME) analysis was performed by GC/MS. Two samples were prepared with approximately 120 mg of bacterial biomass per tube harvested from several culture plates. Fatty acid methyl esters were prepared as described by Sasser³⁰ and GC/MS analysis was carried out as previously described³¹. Briefly, FAMES were separated using an Elite 5-MS column and monitored by mass spectrometry (Clarus 500 - SQ 8S, Perkin Elmer, Courtaboeuf, France). Spectral database search was performed using MS Search 2.0 operated with the following Standard Reference Database 1 A (NIST, Gaithersburg, USA) and FAMES mass spectral database (Wiley, Chichester, UK).

Sequencing, assembly, annotation and genomic comparison. The bacterial genomic DNA (gDNA) of strain EG was extracted using an EZ1 automate and the DNA tissue kit (Qiagen, Hilden, Germany) and then was quantified using a Qubit assay (Life Technologies, Carlsbad, CA, USA) at 82.6 ng/μL. The bacterial gDNA was prepared and sequenced as previously described³². Briefly, sequencing was performed using the Mate-Pair strategy and a Miseq sequencer (Illumina, San Diego, CA, USA). A concentration of 1.5 μg of gDNA prepared following the Nextera Mate-Pair Illumina guide was used to prepare the Mate-Pair library. The gDNA was simultaneously fragmented and tagged using a Mate-Pair junction adapter. Then the fragmentation pattern was validated using a DNA 7500 labchip on a BioAnalyzer (Agilent 2100, Agilent Technologies, Santa Clara, CA, USA). The size of the DNA fragments ranged from 1.5 kb to 11 kb. No size selection was performed and 662 ng of labelled fragments were circularized. Next, circularized DNA was mechanically sheared using a Covaris device S2 (Covaris, Woburn, MA, USA) into small fragments with an optimal size at 1200 bp. The library profile was analysed on a High Sensitivity Bioanalyzer LabChip (Agilent Technologies) and the concentration library was measured at 61.4 nmol/l. Then, the library was loaded on the sequencer after a denaturation step and a dilution at 15 pM. Automated cluster generation and sequencing were performed in a single 39-h run in a 2 × 251-bp and sequencing reads were assembled using the A5 pipeline. Genomic annotation was obtained using the Prokka software. A search for virulence factors was performed by comparison with the VFDB database (<http://www.mgc.ac.cn/VFs/>) using BLASTn^{33,34}.

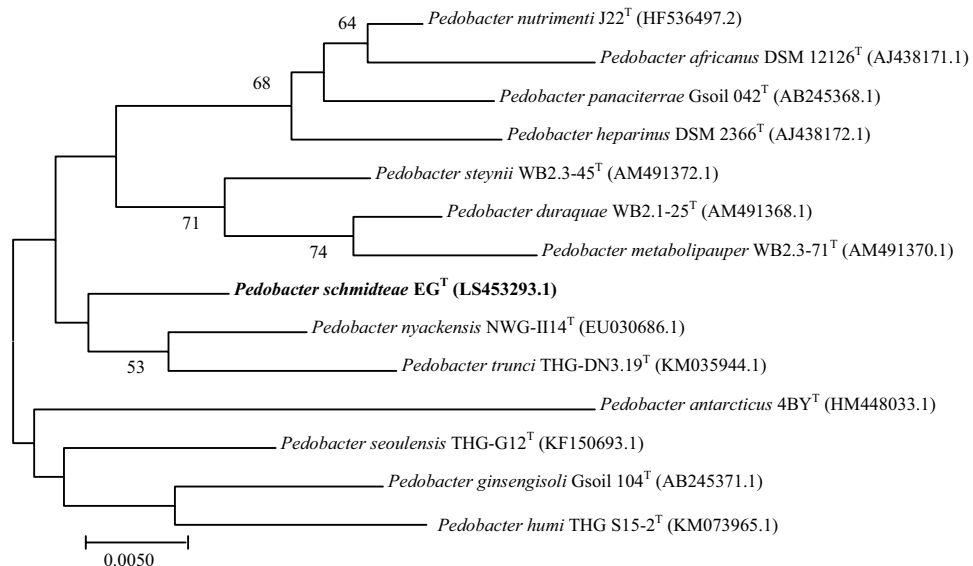

Figure 1. : 16S rRNA-based maximum likelihood phylogenetic tree highlighting the position of *Pedobacter schmidteae* strain EG^T relative to other closely related species. The respective GenBank accession numbers for 16S rRNA genes are indicated in parentheses. Sequences were aligned using CLUSTAL W with default parameters and phylogenies were inferred by the software MEGA 7¹⁸. Numbers at the nodes are percentages of bootstrap values obtained by repeating the analysis 500 times to generate a majority consensus tree. Only bootstrap values $\geq 50\%$ were retained. The scale bar indicates a 0.5% sequence divergence.

The genome from strain EG was compared to those of *Pedobacter africanus* strain DSM 12126^T (NZ_FWXT000000000.1), *P. antarcticus* strain 4BY^T (NZ_JNFF000000000.1), *P. ginsengisoli* strain T01R-27 (NZ_CP024091.1), *P. heparinus* strain DSM 2366^T (NC_013061.1), *P. nutrimenti* strain DSM 27372 (NZ_QKLU000000000.1), *P. nyackensis* strain DSM 19625 (NZ_FWYB000000000.1), *P. panaciterrae* strain 048 (NZ_LGEL000000000.1) and *P. steynii* strain DX4 (NZ_CP017141.1). Degrees of genomic similarity between strain EG and compared genome were evaluated using the GGDC (<http://ggdc.dsmz.de/ggdc.php#>)¹⁶ and Orthologous Average Nucleotide Identity (Ortho-ANI) (<https://www.ezbiocloud.net/tools/orthoani>)³⁵ softwares.

Results and Discussion

Strain isolation, 16S rRNA gene sequencing and phylogenetic analysis. Strain EG was isolated on 5% sheep blood-enriched Columbia agar (bioMérieux) after 2 days at 28 °C in aerobic atmosphere at pH 7. The 16S rRNA-based phylogenetic tree demonstrated that strain EG was most closely related to *Pedobacter nyackensis* strain NWG-II14^T with which it exhibited a sequence similarity of 98.29%. When compared to other *Pedobacter* species, strain EG exhibited 16S rRNA similarity values of 97.84%, 97.69%, 97.63%, 97.93%, 97.43%, 97.28%, 97.33%, 97.62%, 97.93%, 97.32%, 97.32% and 97.0% with *P. heparinus* strain DSM 2366^T, *P. steynii* strain WB2.3-45^T, *P. metabolipauper* strain WB2.3-71^T, *P. nutrimenti* strain J22^T, *P. duraquae* strain WB2.1-25^T, *P. africanus* strain NBRC 100065^T, *P. panaciterrae* strain Gsoil 042^T, *P. ginsengisoli* strain Gsoil 104^T, *P. seoulensis* strain THG-G12^T, *P. trunci* strain THG-DN3.19^T, *P. humi* strain THG S15-2^T and *P. antarcticus* strain 4BY^T³⁶⁻⁴⁰, respectively (Fig. 1).

The analysis of 13 *S. mediterranea* revealed the presence of strain EG in 11 *S. mediterranea* sp. nov. Strain EG is a member of the family *Sphingobacteriaceae* within the phylum *Bacteroidetes* (Table 1).

Phenotypic, enzymatic and biochemical characteristics. After 4 days of culture on blood-enriched Columbia agar, colonies from strain EG were small (0.4 mm of diameter), transparent, round with a convex shape and smooth. Bacterial cells were Gram-negative (Fig. 2), rod-shaped, motile, and non-spore-forming bacilli. Using the Image J software, their mean length and width were 1.98 μm and 0.69 μm , respectively (Fig. 3), without any flagellum. For the two strains EG and *P. nyackensis* NWG-II14^T, no growth was obtained in anaerobic or microaerophilic conditions. Both strains grew at temperatures ranging from 6 to 30 °C in aerobic atmosphere at pH values ranging from 5.5 to 9; the strains also grew at salinity concentrations lower than 25 g/L. Catalase and oxidase activities were positive for both strains.

Strain EG and *P. nyackensis* strain NWG-II14^T were susceptible to benzylpenicillin, ampicillin, ceftriaxone, imipenem, gentamicin, doxycycline and rifampicin (Table 2). Both strains were resistant to amoxicillin, amikacin, daptomycin, metronidazole and vancomycin. *Pedobacter nyackensis*, but not *P. schmidteae*, was susceptible to ciprofloxacin and streptomycin.

Positive and negative reactions obtained using API 50CH, API 20NE, API Zym, and API 20E strips are presented in Table 3. By comparison with *P. nyackensis* NWG-II14^T, strain EG differed by exhibiting of Esterase (C4), Esterase lipase (C8), Valine arylamidase, β -galactosidase and β -glucosidase activities (Table 3). By comparison with all other tested species, strain EG differed in production of esterase (C4) and β -glucosidase.

Property	Term
Current classification	Domain: Bacteria ⁴⁸
	Phylum: Bacteroidetes ^{49–51}
	Class: Sphingobacteriia ⁵²
	Order: Sphingobacteriales ⁵³
	Family: <i>Sphingobacteriaceae</i> ³⁸
	Genus name: <i>Pedobacter</i> ³⁸
	Species name: <i>schmidteae</i>
	Specific epithet: <i>Pedobacter schmidteae</i>
	Type strain: EG
Species status	sp. nov.
Gram stain	Negative
Cell shape	rod-shaped
Motility	Motile
Sporulation	Non-spore-forming
Temperature range for growth	6–30
Temperature optimum	25
pH range for growth	5.5–9
pH optimum	7.5
pH category	Neutrophilic
Lowest NaCl concentration for growth	0
Highest NaCl concentration for growth	25 g/l
Salinity optimum	19 g/l
O ₂ conditions for strain testing	Aerobiosis
Catalase	Positive
Oxydase	Positive
Habitat	Gut microbiota of <i>Schmidtea mediterranea</i>
Biotic relationship	Symbiotic

Table 1. Classification and general features of *Pedobacter schmidteae* strain EG^T.

Figure 2. Gram staining of *Pedobacter schmidteae* strain EG^T.

The analysis of the composition in fatty acid of the strain EG revealed that the major fatty acids were 13-methyl-tetradecanoic acid (49.8%), 9-Hexadecenoic acid (27.7%) and 3-hydroxy-15-methyl-Hexadecanoic acid (7.5%). Other fatty acids included 15-methyl-Hexadecenoic acid (3.6%), 14-Methylpentadec-9-enoic acid (3.4%), Hexadecanoic acid (3.3%), 3-hydroxy-13-methyl-Tetradecanoic acid (1.9%), Tetradecanoic acid

Figure 3. Transmission electron microscopy of *Pedobacter schmidteae* strain EG^T. The bacterium is rod-shaped and exhibits no flagellum (Using Morgani 268D microscope at an operating voltage of 60 kV). Scale bar = 500 nm.

Drug (Antibiotics)	CC	<i>P. schmidteae</i> MIC	<i>P. nyackensis</i> MIC

Table 2. Comparison of antimicrobial susceptibility between *Pedobacter schmidteae* and *P. nyackensis*. For each tested antibiotic (*E*-tests method), minimum inhibitory concentration (MIC) values are indicated. CC: Tested range of drug concentration in µg/ml; MIC in µg/ml.

(1.4%) and 3-hydroxy-Hexadecanoic acid (1.0%). Minor amounts (<1%) of the fatty acids were also detected as Pentadecanoic acid and 9,12-Octadecadienoic acid (Table 4). 15-methyl-Hexadecenoic acid, 14-Methylpentadec-9-enoic acid is detected only in strain EG^T. In contrast to *P. nyackensis* NWG-II14^T, the strain EG have in its membrane composition the 3-hydroxy-Hexadecanoic acid, 13-methyl-Tetradecanoic acid, 3-hydroxy-13-methyl-Tetradecanoic acid, 3-hydroxy-15-methyl-Hexadecanoic acid, 15-methyl-Hexadecenoic acid and 14-Methylpentadec-9-enoic acid; and for the absence of Dodecanoic acid, 3-hydroxy-8-methyl-nonanoic acid, 9-Heptadecenoic acid, 9-Octadecenoic acid.

Genomic characteristics. The genome sequence from strain EG was assembled into one contig of 6,198,518 bp with a G + C content of 41.13%. We identified a total of 5,012 predicted protein-coding genes, in addition to 3 complete rRNA operons, 52 tRNAs and 1 tmRNA. Comparison of these genomic data with those from of closely related species is presented in Table 5. The distribution of genes in functional categories (COGs) is shown within Table 6. In addition, using the Prokka software, we identified a two-component sensor histidine kinase system. This system exhibited an identity of 92% (*E*-value of 10⁻³) and a score of 52 with the GacS

Table 3. Differential biochemical characteristics of *Pedobacter schmidteae* and phylogenetically-related species of the genus *Pedobacter*. Strains: 1, *P. schmidteae* strain EG^T; 2, *P. nyackensis* strain NWG-II14^T; 3, *P. heparinus* strain DSM 2366^T; 4, *P. africanus* DSM 12126^T. The data were completed using previously described characteristics^{38,40} of taxa 3 and 4, and those obtained in the present study. Data presented for the taxa 3 and 4 were collected in previously published work, only results obtained with the same methodologies than used in the present study for the taxa 1 and 2 (see material and methods) were considered. +, positive; –, negative; V, variable; NA, data not available.

[GacS/GacA two-component system]^{41,42} sensor histidine kinase/response regulator in *Pseudomonas putida* strain KT2440 according to the VFDB database. It has been reported that the two-component system signaling pathways are the major signaling mechanisms in bacteria and as well in Archaea⁴³ to monitor external and internal stimuli (including concentration of ions and gas, redox states, levels of nutrients and cell density)⁴⁴. This pathway is also found in simple eukaryota and higher plants⁴⁵. In opportunistic bacterial pathogens, the use of two-components systems is required to regulate the expression of genes necessary for the transition from the environmental reservoir to the host⁴⁶. Digital DNA-DNA hybridization values (dDDH) obtained using the GGDC software are reported in Table 7. For strain EG, these values ranged from 18.90 with *P. nutrimenti* to 21.50% with *P. nyackensis*. Such values were lower than the 70% threshold recognized to delineate distinct species. Similarly, Ortho-ANI values (Fig. 4) ranged from 70.98% with *P. nutrimenti* to 74.65% with *P. nyackensis*, which is lower than the 95% threshold used to discriminate bacterial species. Thus, we could confirm that strain EG belonged to a separate *Pedobacter* species for which we propose the name *Pedobacter schmidteae* sp. nov.

Conclusion

Using the taxono-genomic approach, we concluded that strain EG is the representative strain of the new species *P. schmidteae* sp. nov. Interestingly, *P. schmidteae* sp. nov. is present in 84.6% of *S. mediterranea* worms tested. To best of our knowledge, *P. schmidteae* sp. nov. has never been identified anywhere else than in *S. mediterranea*. Indeed, no nucleotide sequence linked to this new strain has been found in the nr database (BLASTn <https://blast.ncbi.nlm.nih.gov>). To date, we assume that *P. schmidteae* sp. nov. is unique to *S. mediterranea*, but we cannot exclude formally that it might be present in other living organisms of the environment.

Table 4. Comparison between the fatty acid cell composition of *Pedobacter schmidteae* and related species of the genus *Pedobacter*. Taxa: 1, *P. schmidteae* strain EGT; 2, *P. nyackensis* strain NWG-II14T; 3, *P. heparinus* strain DSM 2366 T; 4, *P. africanus* DSM 12126 T. The data were completed using previously described characteristics 38,40 and those obtained in the present study. Data presented for the taxa 3 and 4 were collected in previously published work, only results obtained with the same methodologies than used in the present study for the taxa 1 and 2 (see material and methods) were considered. Tr, Trace (<1%); —, not detected; NA, not applicable.

	Size (bp)	GC %	CDS	rRNA	tRNA	tmRNA
<i>P. schmidteae</i>	6,198,518	41.13	5012	9	52	1
<i>P. nyackensis</i>	1,005,999	39.5	4968	11	51	6
<i>P. heparinus</i>	5,167,383	42	4201	9	45	3
<i>P. steynii</i>	6,581,659	41.3	5375	13	63	3
<i>P. nutrimenti</i>	5,715,103	41.6	4926	6	49	6
<i>P. africanus</i>	5,722,867	43.4	4708	7	44	3
<i>P. panaciterrae</i>	6,342,803	38.4	5153	8	45	2
<i>P. ginsengisoli</i>	5,373,360	37.8	4396	16	53	3
<i>P. antarcticus</i>	4,566,318	40.4	4234	5	48	1

Table 5. Main genomic characteristics of *Pedobacter schmidteae* and other closely related *Pedobacter* species.

Protologue. The protologue is to standardize the format of descriptions of new taxa, supported by the Judicial Commission of the International Committee on Systematic Bacteriology⁴⁷. *Pedobacter schmidteae* (schmid.teae. N.L. gen. n. schmidteae of the planarian genus *Schmidtea*, from which strain EG was isolated). The bacterium belongs to the family *Sphingobacteriaceae* within the phylum Bacteroidetes. The type strain EGT^T (CSUR P6417 = CECT9771) was isolated on 5% sheep blood-enriched Columbia agar after 2 days at 28 °C in aerobic atmosphere at pH 7 from the microbiota of the planarian *S. mediterranea*. Colonies are small, round, smooth, transparent and convex. Bacterial cells are Gram-negative, rod-shaped, motile and non-spore-forming bacilli with positive catalase and oxidase activities. The main cellular fatty acids detected are 13-methyl-tetradecanoic acid (49.8%), 9-Hexadecenoic acid (27.7%), 3-hydroxy-15-methyl-Hexadecanoic acid (7.5%), 15-methyl-Hexadecenoic acid (3.6%), 14-Methylpentadec-9-enoic acid (3.4%), Hexadecanoic acid (3.3%), 3-hydroxy-13-methyl-Tetradecanoic acid (1.9%), Tetradecanoic acid (1.4%) and 3-hydroxy-Hexadecanoic acid (1.0%). We found traces (<1%) of Pentadecanoic acid and 9,12-Octadecadienoic acid.

Using an APIZYM strip, strain EGT^T exhibits positive reactions for catalase, oxidase, alkaline phosphatase, esterase (C4), esterase lipase (C8), leucine arylamidase, valine arylamidase, acid phosphatase, Naphtol-AS-BI-phosphohydrolase, β -galactosidase, α -glucosidase, β -glucosidase, N-acetyl- β -glucosaminidase, esculin ferric citrate, glucose, D-mannose, N-Acetyl-glucosamine and D-maltose, but negative reaction for

Table 7. dDDH values obtained by sequence comparison of all studied genomes using GGDC, formula 2 (DDH Estimates Based on Identities / HSP length).

lipase (C14), cystine arylamidase, trypsin, α -chymotrypsin, α -galactosidase, β -glucuronidase, α -mannosidase, α -fucosidase.

Using a API 50CH strip, strain EG^T is unable to metabolize glycerol, starch, amygdalin, arbutin, D-adonitol, D-arabinose, D-arabitol, D-cellobiose, D-fructose, D-fucose, D-galactose, D-glucose, D-lactose, D-melezitose,

Figure 4. Heatmap generated with OrthoANI values calculated using the OAT software³⁵ between *Pedobacter schmidteae* and other closely related species with standing in nomenclature. The colour code indicates the closest species in green to the farthest in red.

D-melibiose, D-raffinose, D-ribose, D-saccharose, D-sorbitol, D-tagalose, D-trehalose, D-turanose, dulcitol, D-xylose, erythritol, gentiobiose, glycogen, inositol, inulin, L-arabinose, L-arabitol, L-fucose, L-rhamnose, L-sorbose, L-xylose, methyl- α D-Glucopyranoside, methyl- α D-Mannopyranoside, methyl- β D-xylopyranoside, potassium 2-CetoGluconate, potassium 5-Cetogluconate, potassium gluconate, salicin, xylitol.

In addition, strain EG^T use potassium nitrate, L-tryptophane, L-arginine, urea, gelatin, D-mannitol, malic acid, phenylacetic acid, L-lysine, trinitiumcitrate, L-ormithin, Esculin ferric citrate, Glucose, D-mannose, N-Acetyl-glucosamine and D-maltose.

The genome of strain EG^T is 6,198,518 bp-long with a G + C content of 41.13%.

The 16S rRNA gene and genome sequence are deposited in GenBank under accession numbers LS453293 and LS999839, respectively.

MALDI-TOF MS spectrum. The MALDI-TOF MS spectrum of *Pedobacter schmidteae* strain EG^T is available at <http://www.mediterranee-infection.com/article.php?laref=936>

Nucleotide sequence accession number. The 16S rRNA gene sequence and genome sequence were deposited in GenBank under accession numbers LS453293 and LS999839, respectively. The Digital Protologue database Taxonumber for strain EG^T is TA00631 in the <http://imedea.uib-csic.es/dprotologue/> website.

Deposit in culture collections. Strain EG^T (*Pedobacter schmidteae* sp; nov.) was deposited in the CSUR (Collection de Souches de l'Unité des Rickettsies WDCM 875) and CSCT (Colección Española de Cultivos Tipo) strain collections under numbers CSUR P6417 and CECT9771, respectively.
