The title compound, $[\text{Cu}(\text{NO}_3)_2(\text{C}_{10}\text{H}_{16}\text{N}_2\text{O})]$, has been synthesized and characterized by synchrotron single-crystal diffraction at 100 K. The Cu^{II} ion has a distorted square-pyramidal coordination geometry with two N and one O atoms of the $\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}$ ligand and one nitrate anion in the equatorial plane and another nitrate anion at the axial position. The equatorial Cu—N and Cu—O bond lengths are in the range 1.9608 (14)–2.0861 (15) Å, which are shorter than the axial Cu—O_{nitrate} bond length [2.1259 (16) Å]. In the crystal, molecules are linked via intermolecular N—H···O and O—H···O hydrogen bonds, forming a sheet structure parallel to the *bc* plane. The sheets are further linked through a face-to-face $\pi-\pi$ interaction [centroid–centroid distance = 3.994 (1) Å]. Weak intermolecular C—H···O interactions are also observed in the sheet and between adjacent sheets.

1. Chemical context

Transition-metal complexes containing amine or its derivative ligands have attracted considerable attention owing to their diverse coordination geometries and their various applications in catalysis (Ahn *et al.*, 2017), as magnetic materials (Liu, Zhou *et al.*, 2017) and fluorescent substances (Chia & Tay, 2014) as well as sensing materials (Liu, Wang *et al.*, 2017). In addition, polyamine ligands containing hydroxyl groups can easily form multinuclear complexes (such as dinuclear or trinuclear) with various transition-metal ions and hydrogen-bonded supramolecular compounds due to the deprotonation of hydroxyl groups by the transition-metal ions and anions (Shin *et al.*, 2014). For example, *N*-(2-pyridylmethyl)iminodiethanol and *N*-(2-pyridylmethyl)iminodiisopropanol ligands containing amine, pyridine and hydroxyl groups have been used to form trinuclear metal complexes with cobalt and nickel ions, respectively, and these complexes have shown significant olefin epoxidations and magnetic interactions (Shin, Jeong *et al.*, 2016). The nitrate anion is a good candidate for the construction of multinuclear complexes or supramolecular compounds by bridging metal ions or hydrogen bonding adjacent molecules (El-Khatib *et al.*, 2018). Here, we report the preparation and crystal structure of a copper(II) complex, $[\text{Cu}(\text{C}_{10}\text{H}_{16}\text{N}_2\text{O})(\text{NO}_3)_2]$, formed with a functional tridentate ligand, 2-methyl-2-[(2-pyridinylmethyl)amino]-1-propanol, and nitrate anions.

OPEN ACCESS

2. Structural commentary

A view of the molecular structure of the title compound is shown in Fig. 1. The central Cu^{II} ion is coordinated by two nitrogen and one oxygen atoms from the C₁₀H₁₆N₂O ligand and by two oxygen atoms from nitrate anions, and adopts a distorted square-pyramidal geometry. The equatorial plane consists of the two nitrogen atoms (N1 and N2) and the oxygen atom (O1) of the hydroxyl group in the C₁₀H₁₆N₂O ligand and one oxygen atom (O5) of the nitrate anion. The coordination geometry is completed by an oxygen atom (O2) from the other nitrate anion in the axial position. The equatorial bond lengths, Cu—N and Cu—O, are in the range 1.9608 (14) to 2.0861 (15) Å. The axial bond length, Cu—O_{nitrate}, is 2.1259 (16) Å. The average length of the Cu—N and Cu—O bonds between the Cu^{II} ion and the C₁₀H₁₆N₂O ligand is 2.0081 (8) Å, which is shorter than the average bond length in the reported [Cu(C₁₀H₁₆N₂O)Cl₂] complex possessing the same ligand and metal (Shin, Lee *et al.*, 2016). The axial bond

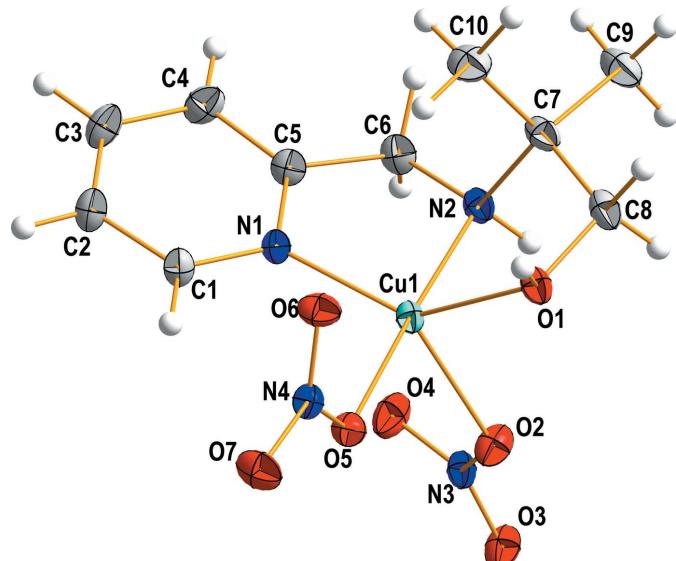

Figure 1

Table 1
Hydrogen-bond geometry (Å, °).

D—H···A	D—H	H···A	D···A	D—H···A
O1—H1O1···O3 ⁱ	0.83 (1)	1.89 (2)	2.685 (2)	159 (4)
N2—H2···O7 ⁱⁱ	0.98 (1)	1.97 (2)	2.930 (3)	167 (3)
C4—H4···O2 ⁱⁱⁱ	0.95	2.31	3.204 (3)	156
C8—H8AB···O5 ^{iv}	0.99	2.55	3.455 (3)	152

Symmetry codes: (i) $x, y, z + 1$; (ii) $-x + \frac{3}{2}, y + \frac{1}{2}, z - \frac{1}{2}$; (iii) $x - \frac{1}{2}, -y + \frac{3}{2}, z$; (iv) $-x + \frac{1}{2}, y + \frac{1}{2}, z + \frac{1}{2}$.

length is also shorter than that in [Cu(C₁₀H₁₆N₂O)Cl₂], which can be attributed to the size effect of the coordinated anions. The nitrate anions are coordinated in a *cis* position to each other and the axial bond is longer than the equatorial bond. The bite angles N1—Cu1—N2 and N2—Cu1—O1 in the five-membered chelate rings are 84.53 (7) and 82.92 (7)°, respectively.

3. Supramolecular features

In the crystal, two nitrate anions form intermolecular hydrogen bonds (O1—H1O1···O3ⁱ, N2—H2···O7ⁱⁱ and C8—H8AB···O5^{iv}; symmetry codes as in Table 1) with adjacent C₁₀H₁₆N₂O ligands, generating an undulating sheet structure parallel to the *bc* plane (Fig. 2). Another C—H···O hydrogen bond (C4—H4···O2ⁱⁱⁱ; Table 1) links the sheets into a three-dimensional structure (Fig. 3). Moreover, the sheets are linked by a π—π interaction between pyridine rings; the distance between the centroids of the pyridine rings is 3.994 (1) Å and the dihedral angle is 19.317 (1)°.

4. Database survey

A search of the Cambridge Structural Database (Version 5.39, update of August 2018; Groom *et al.*, 2016) shows only one mononuclear copper(II) complex with the same $\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}$ ligand, for which the synthesis and crystal structure have been reported (Shin, Lee *et al.*, 2016). A similar copper(II) complex with poly(2,6-dimethyl-1,4-phenylene ether) ligands involving secondary amine, pyridine and hydroxyl groups has been prepared to study its catalytic activities (Guieu *et al.*, 2004).

5. Synthesis and crystallization

The $\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}$ ligand was prepared according to a slight modification of the previous reported method (Shin, Lee *et al.*, 2016). To a methanol solution (10 mL) of $\text{Cu}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$ (200 mg, 0.823 mmol) was added dropwise a methanol solution (10 mL) of $\text{C}_{10}\text{H}_{16}\text{N}_2\text{O}$ (149 mg, 0.823 mmol); the colour became dark blue, and the solution was stirred for 30 min at room temperature. Blue crystals of the title compound were obtained by diffusion of diethyl ether into the dark-blue solution for several days, and collected by filtration and washed with diethyl ether and dried in air (yield: 189 mg, 62%). FT-IR(ATR, cm^{-1}): 3215, 3168, 3071, 2967, 1607, 1506, 1384, 1278, 1065, 1020.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. C-bound H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms, with $\text{C}-\text{H} = 0.95\text{--}0.99 \text{\AA}$, and with $U_{\text{iso}}(\text{H}) = 1.5$ or $1.2U_{\text{eq}}(\text{C})$. The positions of the O- and N-bound H atoms were assigned based on a difference-Fourier map, and

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
