Received 27 June 2009; accepted 3 July 2009

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.058; wR factor = 0.118; data-to-parameter ratio = 14.7.

In the title compound, $C_{31}H_{25}\text{NO}$, the oxazine ring adopts a half-chair conformation. The dihedral angles between the phenyl rings and the naphthyl ring system are $70.89(8)$, $37.34(10)$ and $9.42(10)^\circ$. The crystal structure is stabilized by an aromatic $\pi-\pi$ stacking interaction, with a centroid–centroid distance of $3.879(3)\text{ \AA}$.

2-Benzyl-1,3-diphenyl-2,3-dihydro-1*H*-naphtho[1,2-*e*][1,3]oxazine

Y. Zhang and Y. H. Li

Comment

Continuing efforts have been made to synthesize oxazine compounds (Alfonsov *et al.*, 2007) because they are widely used as antipsychotic agents, antimalarial agents, and serotonin and dopamine receptors agonists (Peglion *et al.*, 1997; Xu *et al.* 2004). We have prepared a novel compound, 2-benzyl-1,3-diphenyl-2,3-dihydro-1*H*-naphtho[1,2-*e*][1,3]oxazine, by the reaction of 2-naphthol, benzaldehyde and phenylmethanamine, and we report in this paper its synthesis and crystal structure. The structures of some closely related compounds have been reported (Alfonsov *et al.*, 2007; Li *et al.*, 2008).

The molecule of the title compound has normal geometric parameters. The oxazine ring adopts a half chair conformation. The dihedral angles formed by the naphthyl ring system with the C12—C17, C19—C24 and C26—C31 phenyl rings are 70.89 (8), 37.34 (10) and 9.42 (10) $^{\circ}$, respectively. The crystal structure is stabilized by an aromatic π — π stacking interaction involving the C26—C31 phenyl ring at (x, y, z) and the C5—C10 ring of the naphthyl ring system at (1+x, y, z), with a centroid to centroid distance of 3.879 (3) Å.

Experimental

The title compound was one of the products of the reaction between 2-naphthol, phenylmethanamine and an excess amount of benzaldehyde. Benzaldehyde (3.18 g, 0.03 mol) and phenylmethanamine (1.605 g, 0.015 mol) were added to 2-naphthol (2.16 g, 0.015 mol) without solvent under nitrogen atmosphere. The temperature was gradually raised to 120°C in one hour and the mixture was stirred at this temperature for 10 h. The mixture was then treated with ethanol (95%, 20 ml) and cooled to room temperature. The precipitate was filtered and washed with a small amount of ethanol. The title compound was isolated using column chromatography (petroleum ether / ethyl acetate, 2:1 v/v). Single crystals suitable for X-ray diffraction analysis were obtained by slow evaporation of an ethyl acetate solution.

Refinement

H atoms were positioned geometrically and refined using a riding model, with C—H = 0.93–0.98 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Figures

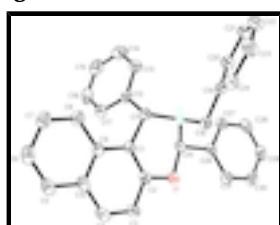

Fig. 1. The molecular structure of the title compound, showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are omitted for clarity.

Refinement

Refinement on F^2	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.058$	$w = 1/[\sigma^2(F_o^2) + (0.0185P)^2 + 1.004P]$
$wR(F^2) = 0.118$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.00$	$(\Delta/\sigma)_{\max} < 0.001$
4392 reflections	$\Delta\rho_{\max} = 0.16 \text{ e \AA}^{-3}$
299 parameters	$\Delta\rho_{\min} = -0.20 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: SHELXL97 (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001xF_c^2\lambda^3/\sin(2\theta)]^{-1/4}$
Secondary atom site location: difference Fourier map	Extinction coefficient: 0.0082 (6)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
