

## Bis[N,N-bis(diphenylphosphanyl)cyclohexylamine- $\kappa^2P,P'$ ]platinum(II) bis(hexafluoridophosphate) dichloromethane disolvate

Ilana Engelbrecht,\* Hendrik G. Visser and Andreas Roodt

Department of Chemistry, University of the Free State, PO Box 339, Bloemfontein 9300, South Africa

Correspondence e-mail: Engelbrecht@ufs.ac.za

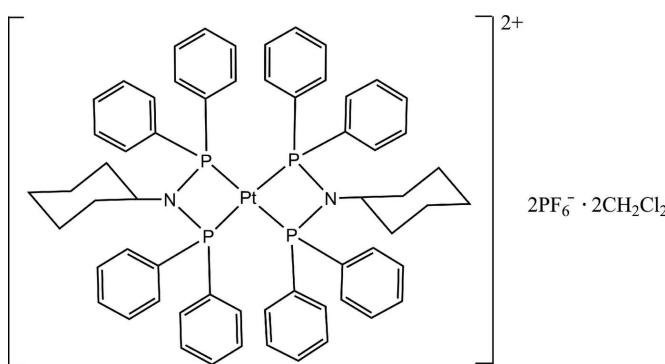

Received 9 July 2010; accepted 19 July 2010

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.027;  $wR$  factor = 0.070; data-to-parameter ratio = 15.7.

In the title compound,  $[\text{Pt}(\text{C}_{30}\text{H}_{31}\text{NP}_2)_2](\text{PF}_6)_2 \cdot 2\text{CH}_2\text{Cl}_2$ , the four-coordinated  $\text{Pt}^{II}$  atom, situated on an inversion centre, exhibits a highly distorted square-planar geometry illustrated by the  $\text{P}-\text{Pt}-\text{P}$  bite angle of  $70.76(3)^\circ$ . The cyclohexyl ring and one of the phenyl rings display  $0.630(7):0.37(7)$  and  $0.60(2):0.40(2)$  positional disorder, respectively. The dichloromethane solvent molecule displays  $0.526(4):0.474(4)$  positional disorder.  $\text{C}-\text{H}\cdots\text{F}$  hydrogen bonds stabilize the crystal packing.

## **Bis[N,N-bis(diphenylphosphanyl)cyclohexylamine- $\kappa^2P,P'$ ]platinum(II) bis(hexafluoridophosphate) dichloromethane disolvate**

**I. Engelbrecht, H. G. Visser and A. Roodt**

### **Comment**

The synthesis of Pt(II) diphosphinoamine complexes forms part of ongoing research in our group in the field of homogeneous catalysis (Brink *et al.*, 2010; Otto *et al.*, 1998; Roodt & Steyn, 2000; Steyn *et al.*, 1992, 1997, 2008; Viljoen *et al.*, 2008, 2009a,b, 2010). In the title compound (Fig. 1, Table 1), the Pt<sup>II</sup> atom is situated on an inversion centre. The strain in the complex is illustrated by the distorted square-planar geometry around the Pt atom, with a P—Pt—P bite angle of 70.76 (3)°, forcing the P1—N1—P2 angle to 102.58 (12)° and demonstrating the deviation from the ideal tetrahedral geometry of the N atom. The N atom is displaced by 0.166 (3) and -0.081 (3) Å from the C1A, P1, P2 and C1B, P1, P2 planes respectively, showing that the N atom adopts an almost planar geometry with the two P atoms and the C atom attached to it to accommodate the steric bulk of the phenyl groups and the cyclohexyl ring of the ligand. The P atoms are also severely distorted from the expected tetrahedral configuration with Pt1—P1—N1 and Pt1—P2—N1 angles being 93.47 (8) and 93.08 (9)°, respectively. The cyclohexyl ring, bonded to the N atom, and the C11-phenyl ring, bonded to P1, display 0.63:0.37 and 0.60:0.40 positional disorder, respectively. The dichloromethane molecules display 0.53:0.47 positional disorder (Fig. 2). Molecules of the title compound pack in horizontal rows across the *bc* plane in the unit cell (Fig. 3). Intermolecular hydrogen bonds exist between C12A—H12A and F2 and C32—H32 and F2 (Table 2).

### **Experimental**

Pt(cod)Cl<sub>2</sub> (20 mg, 0.054 mmol) (cod = 1,5-cyclooctadiene) dissolved in a minimum amount of dichloromethane was added in a rapid dropwise manner to a solution of bis(diphenylphosphino)cyclohexylamine (52.5 mg, 0.112 mmol) and NaPF<sub>6</sub> (19.8 mg, 0.118 mmol) dissolved in a minimum volume of dichloromethane/methanol (1:1). After stirring for 20 min, the solvent was removed completely under reduced pressure. Dichloromethane was added until no further dissolution of solid was evident. The resulting heterogeneous mixture was filtered to remove the insoluble NaCl by-product. The colourless solid product was precipitated upon addition of methanol followed by a reduction in solvent volume under reduced pressure. The compound was isolated by filtration and washed with diethyl ether (10 cm<sup>3</sup>). Layering of a dichloromethane solution of the product with methanol gave colourless crystals, suitable for X-ray diffraction (crude yield: 44 mg, 73%). Spectroscopy data: <sup>1</sup>H NMR (600 MHz, CD<sub>2</sub>Cl<sub>2</sub>): δ = 0.6 to 1.4 (m, 18H), 3.1 (m, 2H), 3.6 (m, 2H), 7.4 to 7.7 (m, 20H). <sup>31</sup>P NMR (243 MHz, CD<sub>2</sub>Cl<sub>2</sub>): δ = 39.9 (t, <sup>1</sup>J<sub>Pt—P</sub> = 1062.0 Hz), -135.2 to -152.7 (m, PF<sub>6</sub>).

### **Refinement**

H atoms were positioned geometrically and refined as riding atoms, with C—H = 0.95 (aromatic), 1.00 (CH) and 0.99 (CH<sub>2</sub>) Å and *U*<sub>iso</sub>(H) = 1.2*U*<sub>eq</sub>(C). The highest residual peak is located 0.15 Å from CL1A and the deepest hole is situated 0.56 Å from CL1B.
