Polycyclic aromatic hydrocarbons (PAHs)

Terrestrial soils

Pakistan

ABSTRACT

Over the past few decades, polycyclic aromatic hydrocarbons (PAHs) have been analysed in various environmental compartments, however, only limited information is available associated with their terrestrial concentrations in Pakistan and Antarctica. All terrestrial soils from Pakistan ($n = 120$) were collected from 14th to 2nd April 2017 at Islamabad ($n = 30$), Abbottabad ($n = 10$), Taxilla ($n = 5$), and other places from north to south ($n = 75$). All Antarctic terrestrial soils ($n = 11$) were collected from 1st to 25th February 2018 in the southwestern part of King George Island. It is crucial to underline that all samples were both qualitatively

and quantitatively identified by using a Shimadzu GCMS-QP2010 Ultra system coupled with a high-speed performance system with ASSP function (i.e., achieving maximum scan speed of 20,000 u sec⁻¹) and having ultra-fast data acquisition speed for comprehensive two-dimensional gas chromatography (GC × GC). Analytical results implicate the influences of vehicle exhausts as a major contributor of PAHs in terrestrial soils of Pakistan. It seems rationale to conclude that 3-ring PAHs display the majority of PAH congeners in terrestrial soils of King George Island.

Specifications Table

Subject area	Environmental Sciences
More specific subject area	Environmental Chemistry
Type of data	Table, text file, graph, figure
How data was acquired	Soxhlet extraction and Shimadzu GCMS-QP2010 Ultra system coupled with a high-speed performance system with ASSP function [1]
Data format	Raw data, analysed.
Experimental factors	Sampling protocol precautions, sample preparation, and quality control/quality assurance (QA/QC) were comprehensively documented in United States Environmental Protection Agency (US-EPA) Method 5035 for soil sampling and will not be mentioned here [2]. Chemical extraction is performed in Soxhlet equipment with dichloromethane and hexane [3].
Experimental features	PAH congeners applying GC-MS.
Data source locations	All samples were collected from terrestrial soils located at Hunza, Gilgit, Skardu, Kalam Swat, Gulibagh Swat, Malamjaba Swat, Swabi, Nowshera, Mianwali, Bhakkar, Layyah, D.G Khan, Sukkar, Khairpur, Hyderabad, Abbottabad, Mansehra, Murree, Islamabad, and King George Island.
Data accessibility	Data available within article.

Value of the data

- PAHs with low biodegradability and high persistency in environment, which is acknowledged as priority pollutants by US EPA as a consequence of its carcinogenic and mutagenic impacts therefore applying the suitable policy is the requirement to control PAHs and reducing of its concern. Data can be used as to facilitate policy and decision making process in order to control and decreasing the level of PAH contamination present in the terrestrial soils of Pakistan and King George Island, Antarctica.
- Since long range atmospheric transportation is responsible for POPs contamination of pristine and sensitive environments, a long term monitoring of PAH congeners is therefore essentially crucial for conducting environmental risk assessment at King George Island, Antarctica.
- Data exhibited here may serve as benchmarks for other scientific communities focusing in the field of ecological toxicology to evaluate human expose to PAHs via dietary, inhalation, and dermal contact in Pakistan and King George Island, Antarctica.
- The present data offers detailed information on molecular fingerprints of soil PAHs as obtained through GC/MS-MS. Further investigations for source identifications can be conducted by using diagnostic binary ratios of PAHs provided by this study.
- Data set of PAHs collected at King George Island, Antarctica can be used to conduct the source apportionment (e.g. principal component analysis (PCA), positive matrix factorization (PMF), and UNMIX) of PAHs in terrestrial soils of Pakistan and King George Island.

1. Data

Table 1 and **Table 2** demonstrate sampling positions of terrestrial soil samples collected from Pakistan and King George Island, respectively. **Tables 3 and 4** and **Tables 5 and 6** are presenting the concentrations of PAHs collected at Pakistan and King George Island, respectively.

Table 6

PAH congener concentrations (pg g^{-1}) of Chry, B[b]F, B[k]F, B[e]P, B[a]P, Ind, D[a,h]A, and B[g,h,i]P in terrestrial soils of King George Island, Antarctica.

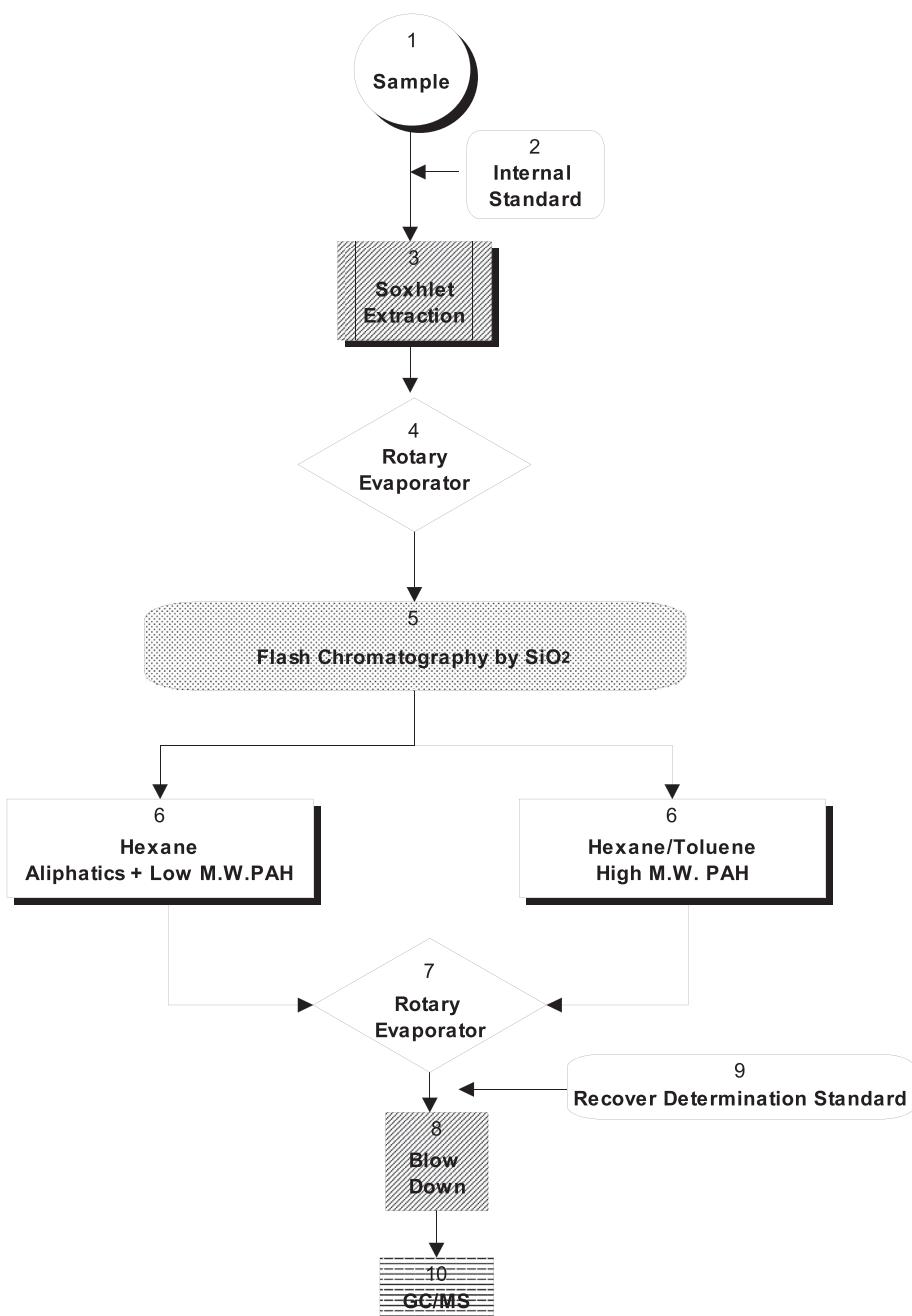

Fig. 1. Analytical protocol of PAH congeners used in this study.

2. Experimental design, materials and methods

2.1. Dataset area

All terrestrial soil samples were collected from different locations in Pakistan and King George Island (see Figs. 1 and 2).

2.2. Sample collection and analytical procedures

In this study, about 0.3 kg of terrestrial soil samples from an area of 1 m² at each sampling site was obtained by applying a shovel, which was stored in clean aluminium foil, situated in a glass bottle, and stored at –20 °C. After removing stones and shells, the samples were freeze-dried and sieved to <0.076 mm (200 mesh), and then stored at –20 °C until analysis. Details of the standard methods used for the soil sampling protocol can be found in previous publications [3–5]. Chemical analysis of PAH congeners are conducted in 2018 and described in Fig. 1. All details of GC-MS analysis are clearly explained in a previous study [7]. The fractionation/cleanup process followed the method reported by Gogou et al. (1996) [6]. After the extraction, the DCM solvent was concentrated to dryness by a combination of rotary evaporation and blowing under a gentle nitrogen stream. The concentrated extract is then diluted in 10 ml of n-hexane before application to the top of a disposable silica gel column. The extract was then fractionated into individual compound classes by flash chromatography on silica gel as follows: The concentrate was applied to the top of a 30 × 0.7 cm diameter column, containing 1.5 g of silica gel (activated at 150 °C for 3 h). Nitrogen pressure was used to in order to obtain a flow of 1.4 ml min^{−1} at the bottom of the column. The following solvents were used to elute the different compound classes: (1) 15 ml n-hexane (fraction 1, light molecular weight PAHs); (2) 15 ml toluene-n-hexane (5.6:9.4) (fraction 2, middle and heavy molecular weight PAHs). All solvents were of HPLC grade, purchased from Fisher Scientific. A mix of standard solutions of 13 native PAHs [Norwegian Standard (NS 9815: S-4008-100-T): phenanthrene (Phe), anthracene (An), fluoranthene (Fluo), pyrene (Pyr), benz[a]anthracene (B[a]A), chrysene (Chry), benzo[b]fluoranthene (B[b]F), benzo[k]fluoranthene (B[k] F), benzo[a]pyrene (B[a]P), benzo[e]pyrene (B[e]P), indeno[1,2,3-c,d]pyrene (Ind), dibenz[a,h]anthracene (D[a,h]A), and benzo[g,h,i]perylene (B[g,h,i]P), and a mix of recovery internal standard (IS) PAHs

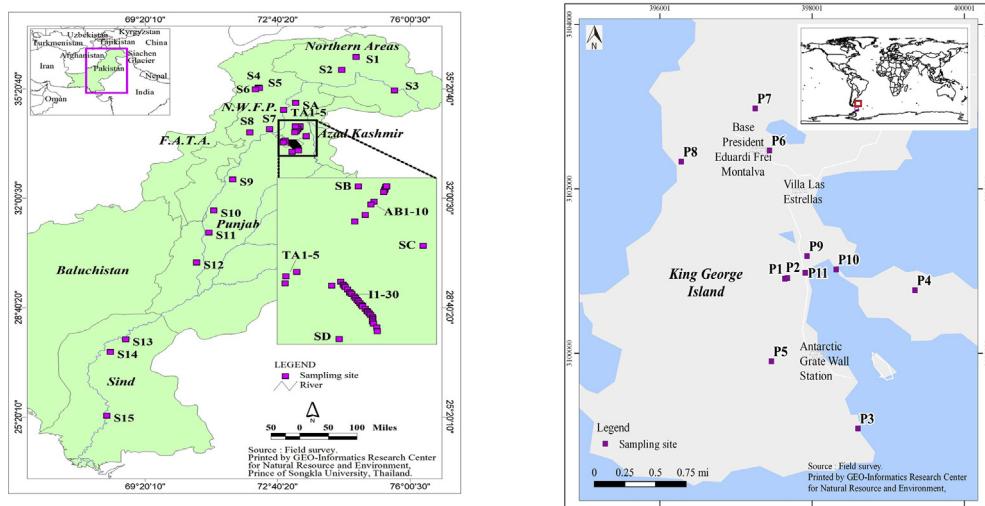

Fig. 2. Sampling sites of terrestrial soils collected at Pakistan and King George Island, Antarctica.

[d_{12} -perylene (d_{12} -Per) and d_{10} -fluorene (d_{10} -Fl)] were purchased from Chiron AS (Stiklestadveine 1, N-7041 Trondheim, Norway).

Acknowledgements

The authors acknowledge the Information Technology Foundation under the Initiative of Her Royal Highness Princess Maha Chakri Sirindhorn, Polar Research Project under the Initiatives of Her Royal Highness Princess Maha Chakri Sirindhorn, National Science and Technology Development Agency (NSTDA), Chinese Arctic and Antarctic Administration, and T. C. Pharmaceutical Industries Co., Ltd for supporting this study. The authors would also like to thank all members of CHINARE 34 for their kind assistances. The authors appreciate kind assistances from Ms. Mattanawadee Hattayanone for her contribution on laboratory works. All the GC-MS analysis of PAHs was conducted at Bara Scientific laboratory under the guidance of Mr. Chukkapong Khumsup, Mr. Itthipon Kittikoon, and Mr. Phoosak Hirunyatrakul.

Conflict of interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.
