Received 10 April 2008; accepted 28 April 2008

Key indicators: single-crystal X-ray study; T = 298 K; mean σ (C–C) = 0.003 Å; *R* factor = 0.043: *wR* factor = 0.125: data-to-parameter ratio = 14.9.

The molecule of the title compound, $C_{16}H_{16}N_2OS$, is not planar; the two aromatic rings are inclined to one another by $37.59 (9)^{\circ}$. There are intramolecular hydrogen bonds between the benzovl O atom and the H atom of the thioamide N atom, and between the thiourea S atom and the H atom of the tolvl group. These hydrogen bonds stabilize the molecule in such a way that the thiourea group adopts a trans-cis geometry. In the crystal structure, molecules are linked by $N-H\cdots S$ intermolecular hydrogen bonds, forming centrosymmetric dimers.

1-(2-Methylbenzoyl)-3-m-tolylthiourea

B. M. Yamin, S. Yousuf, M. S. M. Yusof and T. N. D. T. Zakaria

Comment

The title compound, (I), is analogus to 1-(2,3-Dimethylphenyl)-3-(2-methylbenzoyl)thiourea (II) (Khawar Rauf *et al.*, 2007), but with the 2,3-dimethyl phenyl group replaced by a 2-methyl phenyl (m-tolyl) group (Fig. 1). The molecule maintains the *trans-cis* configuration with respect to the position of the methyl benzoyl and 3-methyl benzene groups, respectively, relative to the thiono S1 atom. The bond lengths and angles are in normal ranges (Allen *et al.*, 1987). The central thiourea moiety, S1/N1/N2/C9, the 2-methylbenzoyl ring, (C1—C8), and the m-tolyl group (C10—C15,C16) are all relatively planar, with a maximum deviation from any best mean plane of 0.015 (2) Å for atom C10. The central thiourea moiety makes dihedral angles with the 2-methylbenzoyl and m-tolyl fragments of 49.61 (7) and 17.87 (9)°, respectively. The *trans-cis* geometry of the thiourea moiety is stabilized by N2—H2A···O1, C7—H7C···O1 and C15—H15A···S1 intramolecular hydrogen bonds (Table 1).

In the crystal structure of (I), symmetry related molecules are linked by the N1—H1A…S1 intermolecular hydrogen bonds (Table 1) to form cenntrosymmetric dimers (Fig 2).

Experimental

2-methylbenzoyl chloride (9.720 g, 0.025mole) was mixed with an equimolar amount of ammonium thiocyanate (1.903 g, 0.025 mol) and 3-methyl aniline (2.701 g, 0.025 mol) in 45 ml dry acetone. The mixture was refluxed with stirring for 4 h. The solution was then filtered and left to evaporate at room temperature. Colourless crystals, suitable for X-ray aanalysis, were obtained after a few days (Yield 85%).

Refinement

NH and C-bound H atoms were positioned geometrically and constrained to ride on their parent atoms: N—H = 0.86 and C—H = 0.93 - 0.96 Å, with U_{iso} (H)= 1.2 U_{eq} (CH and NH), and 1.5 U_{eq} (CH₃).

Figures

Fig. 1. The molecular structure of compound (1), with displacement ellipsoids drawn at 50% probability level (The dashed lines indicate the intramolecular hydrogen bonds).

Fig. 2. The crystal packing diagram of compound (1), showing the formation of the N-H···S hydrogen bonded dimers (Hydrogen bonds are shown by dashed lines).

Refinement

Refinement on F^2 Least-squares matrix: full $R[F^2 > 2\sigma(F^2)] = 0.043$ $wR(F^2) = 0.125$ Secondary atom site location: difference Fourier map Hydrogen site location: inferred from neighbouring sites H-atom parameters constrained $w = 1/[\sigma^2(F_o^2) + (0.077P)^2 + 0.124P]$

where $P = (F_0^2 + 2F_c^2)/3$
$(\Delta/\sigma)_{max} < 0.000$
$\Delta \rho_{max} = 0.23 \text{ e } \text{\AA}^{-3}$
$\Delta \rho_{min} = -0.28 \text{ e } \text{\AA}^{-3}$

Primary atom site location: structure-invariant direct methods Extinction correction: none

Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2 , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
