Background: B3GNT3 (β 1, 3-N-acetylglucosaminyltransferase-3) belongs to the β 3GlcNAcT family and is essential to form extended core 1 oligosaccharides. Previous studies revealed that B3GNT3 expression was dysregulated in multiple cancers. Here, we aimed to understand the expression profile and function of B3GNT3 in lung cancer.

Materials and Methods: The expression of B3GNT3 was measured by immunohistochemistry and public database analysis. B3GNT3 was knocked down to evaluate the lung cancer cell proliferation, migration and invasion in in vitro and in vivo tumor formation experiments. miR-149-5p targeting B3GNT3 was identified with TargetScan analysis and confirmed with reporter assay. Overexpression of miR-149-5p was achieved using microRNA mimics and function of microRNA-149-5p/B3GNT3 axis was tested in vitro.

Results: B3GNT3 was upregulated in lung cancer, and B3GNT3 overexpression was associated with poor prognosis of lung cancer patients. High expression of B3GNT3 was associated with advanced TNM stages, larger tumor size, tumor metastasis and recurrence. Functionally, we demonstrated that knockdown of B3GNT3 suppressed lung cancer cell growth and invasion in vitro. Knockdown of B3GNT3 suppressed lung cancer development in a xenograft tumor model. Moreover, miR-149-5p was validated to negatively regulate B3GNT3 expression through directly targeting B3GNT3 3'-UTR. Overexpression of miR-149-5p could antagonize the tumorigenesis effect of B3GNT3 in vitro.

Conclusion: In summary, our study demonstrated that B3GNT3 overexpression was correlated with poor prognosis of lung cancer patient, indicating that B3GNT3 could be a promising prognostic biomarker for lung cancer. miR-149-5p negatively regulated B3GNT3 expression, which might be utilized for therapeutic target in lung cancer.

Keywords: B3GNT3, lung cancer, miR-149-5p, tumor progression

Introduction

Lung cancer is one of the most common causes of cancer-related death, which has high morbidity and mortality worldwide.¹ Though great advance has been achieved during the past decades regarding the new therapeutic strategies such as surgery and adjuvant therapy, lung cancer prognosis remains poor due to the high chance of lung cancer recurrence and metastasis.^{2,3} Thus, it is crucial to identify new biomarkers and therapeutic targets for lung cancer treatment.

B3GNT3 (β 1, 3-N-acetylglucosaminyltransferase-3) belongs to the β 3GlcNAcT family and is essential to form extended core 1 oligosaccharides.^{4,5} Multiple β 3GlcNAcT family members are demonstrated to be involved in tumor development

and progression.^{6,7} B3GNT3, which is constitutively expressed in neutrophils, lymphocytes, colon, stomach and small intestine, has been discovered playing in crucial roles in various tumors.^{4,8,9} Mounting evidence has shown that B3GNT3 functions as an oncogene and promotes tumor development and metastasis, such as cervical cancer, pancreatic cancer.^{10,11} Meanwhile, B3GNT3 impeded tumor cell migration and invasion in neuroblastoma, which indicated its tumor suppressor role.⁹ In non-small cell lung cancer patients, upregulated B3GNT3 expression was significantly correlated with poor overall survival.¹² However, the detailed function of B3GNT3 and how B3GNT3 expression is regulated in lung cancer remains unclear.

MicroRNAs (miRNAs) are a group of small non-coding RNAs, post-transcriptionally regulating target gene expression via base-pairing to the target gene mRNAs.¹³ Accumulating evidence has shown that miRNAs have important roles in lung cancer development, progression and metastasis.^{14,15} MicroRNAs, such as miR-494, miR-153 and miR-218, inhibited lung cancer development and metastasis via suppressing cellular proliferation, inhibiting cell migration and invasion and EMT.^{16–18}

Here, we found that B3GNT3 was overexpressed in lung cancer and upregulated expression of B3GNT3 was associated with unfavorable prognosis of lung cancer patients. Silencing B3GNT3 inhibited lung cancer cell growth in vitro and suppressed lung tumor development in vivo. We further identified miR-149-5p negatively regulated B3GNT3 via targeting its 3'-UTR. In summary, our data indicate that miR-149-5p/B3GNT3 could be utilized as a potential therapeutic target in lung cancer.

Materials and Methods

Human Specimen

120 paired lung cancer tissue sections and adjacent non-cancer tissues were obtained via surgical section at the Second Affiliated Hospital of Guangxi Medical University. All patients provided written informed consent. The study was reviewed and approved by the Research Ethics Committee of Guangxi Medical University and was carried out following the principles of the Declaration of Helsinki. The clinicopathological features of 120 lung cancer patients were shown in [Supplementary Table 1](#).

Cell Culture

Lung cancer cell line (A549, H1299), and HEK293 were from Cell Bank of Shanghai (Shanghai, China) and maintained in

DMEM cell culture medium containing 10% FBS, 1% streptomycin and penicillin (all from Life Technologies, CA, USA) in cell culture incubator (5% CO₂, 37°C).

qRT-PCR

QRT-PCR was conducted as previously described.¹⁹ Primers used were listed as following: B3GNT3 Forward primer: AGGCACAGACTCACGGAGACAT; Reverse primer: GTTGAGCACGAAGCTGGCGTTG; GAPDH Forward primer: GTCTCCTCTGACTTCAACAGCG; Reverse primer: ACCACCCTGTTGCTGTAGCCAA; PCR primers for detecting miR-149-5p and U6 RNA were obtained from Ribobio. Relative B3GNT3 or miR-149-5p expression was normalized to GAPDH or U6 RNA level using the 2^{-ΔΔCt} method, respectively.

siRNA/shRNA/miRNA Mimics or Inhibitor Transfection

B3GNT3 siRNA or shRNA vectors and relative negative controls, miR-149-5p mimics or miR-149-5p inhibitor was purchased from GenePharma (Shanghai, China). Lipofectamine 3000 (Thermo fisher Scientific, CA USA) was utilized for cell transfection. The sequences of synthetic oligonucleotides about miR-149-5p mimics, inhibitor and relative negative controls in [Supplementary Table 2](#).

Western Blot Analysis

Western blot was conducted as previously described.¹⁹ Antibodies used in this study were listed as following: anti-B3GNT3 (ab96267, Abcam, United Kingdom), anti-GAPDH (ab8245, Abcam, United Kingdom).

Cell Growth Assays

Cell growth was assessed using CCK-8 assay, EdU staining assay and colony formation assays as previously described.²⁰

Transwell Assay

Cell invasion was assessed using transwell assay. Briefly, 2 × 10⁴ cells were seeded into the top chambers with Matrigel-coated membrane (Corning, USA) in 100 μL serum-free medium. Bottom chamber was filled with complete medium. Cells were cultured for 36 h and then cells invaded to the lower chamber were counted under a microscope with 0.5% crystal violet staining.

Tissue Microarray and Immunohistochemistry

Tissue microarrays (TMAs) were established with lung cancer tissues and paired normal tissues. Immunohistochemical staining (IHC) was carried out on sections using antibodies against B3GNT3 (1:100, ab96267, Abcam, Cambridge, United Kingdom) and Ki-67 (D2H10, Cell signalling technology, USA) as previously described.²¹ Sections were semi-quantitatively scored for the B3GNT3 staining patterns as follows: the staining extent in each sample was scored as 1+ (<25% staining region), 2+ (25–50% staining region), 3+ (50% to 75% staining region), or 4+ (>75% staining region). The staining intensity was quantified as 0 (negative), 1+ (weak), 2+ (intermediate), or 3+ (strong). The final score was obtained by multiplying the intensity and extension values (range 0–12) and the samples were grouped as 1+ (score 0), 2+ (score 1–2), 3+ (score 3–4), 4+ (score 6–8), and 5+ (score 9–12) staining. Meanwhile, for statistical purposes, scores of 4+ and 5+ were defined as B3GNT3 high expression and the other final scores were considered as B3GNT3 low expression. For quantification of relative IHC staining intensity of B3GNT3 and Ki-67 in mouse xenograft tumors, we used the ImageJ software (NIH, USA) to quantify the staining intensity and set the control group (sh-NC) as relative staining intensity of 1. IHC staining intensity was scored and categorized by two independent investigators.

Luciferase Reporter Assay

B3GNT3 WT or mutated 3'-UTR sequences were constructed into the luciferase reporter vector (Genecopoeia, Rockville, MD, USA). HEK293 cells were transfected with reporter vectors containing WT or mutated 3'-UTR of B3GNT3 sequences, together with negative control or miR-149-5p mimics. 48 hrs later, the relative luciferase activity was analyzed as previously described.¹⁹

Bioinformatics Analysis

Lung cancer patient datasets in The Cancer Genome Atlas (TCGA) were analysed and mRNA expression profiles of B3GNT3 and patient-related clinical information were obtained and analysed as previously described.²² Overall survival (OS) and disease-free survival (DFS) were examined by Kaplan-Meier survival analysis and Log-rank tests.

Xenograft Tumor Model

BALB/c nude mice (5–6 weeks) were obtained from Shanghai Laboratory Animal Center (Shanghai, China). 5×10^6 lung

cancer A549 control cells or with B3GNT3 stable knockdown were subcutaneously injected into nude mice. Tumor size was measured with a vernier caliper and the tumor volume was determined ($\text{length} \times \text{width}^2 \times 1/2$). Tumorigenesis was also recorded by a bioluminescence imaging system (Caliper, USA). The xenograft tumor experiment was approved by the Experimental Animal Ethics Committee of Guangxi Medical University. In addition, Guide for the Care and Use of Laboratory Animals (8th edition) was strictly followed in the present study.

Statistics

GraphPad Prism 6 was used for statistical analysis. All the results were showed as mean \pm standard deviation (SD). Student's *t*-test or one-way analysis of variance was used for calculation of *p* values where necessary. Statistical significance was defined as a *p* value < 0.05.

Results

B3GNT3 is Overexpressed in Lung Cancer Tissues and Upregulated Expression of B3GNT3 Expression is Associated with Unfavorable Prognosis in TCGA Lung Cancer Cohort

We first analyzed the B3GNT3 expression pattern in lung cancers by bioinformatics analysis of TCGA cohort. B3GNT3 expression was significantly higher in lung adenocarcinoma (LUAD) and lung squamous cell carcinoma (LUSC) than that in control tissues in TCGA cohort (Figure 1A and B). Furthermore, lung cancers with advanced TNM stages (TNM III–IV) had markedly higher B3GNT3 expression than that in lung cancers with TNM I–II (Figure 1C and D). In addition, B3GNT3 expression was positively correlated with the expression of Ki-67 and PCNA (Figure 1E–H). We further investigated patient prognosis in lung TCGA LUAD cohort and TCGA LUSC cohort. Lung cancer patients with high B3GNT3 expression exhibited statistically lower OS and DFS rates than patients with low B3GNT3 expression (Figure 1I and J).

High Expression Level of B3GNT3 is Correlated with Advanced Lung Cancer Stages and Unfavorable Prognosis in TMA Cohort

To further validate the level of B3GNT3 and the correlation of B3GNT3 levels with prognosis, we analyzed B3GNT3

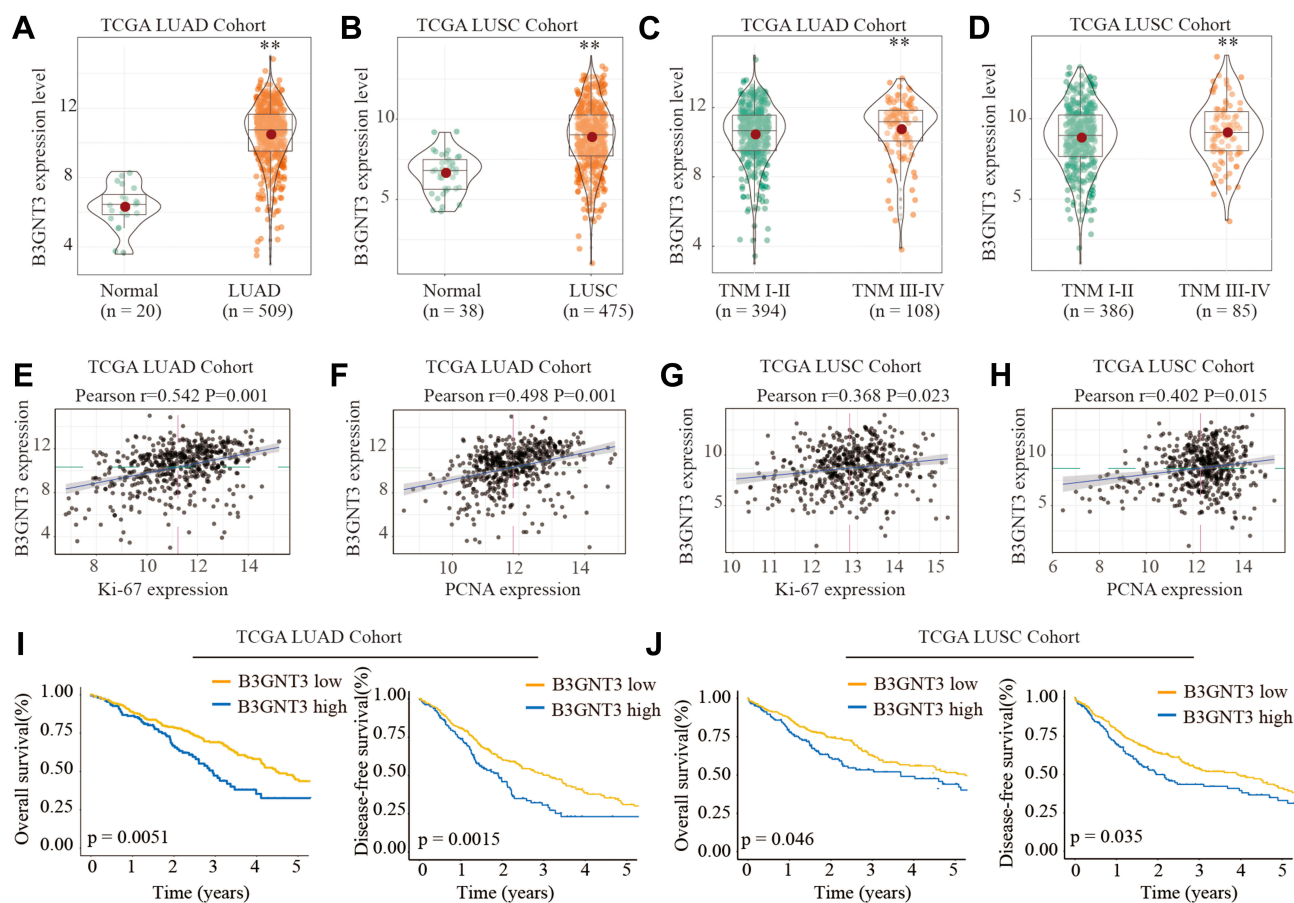

Figure 1 B3GNT3 is upregulated in lung cancer and high level of B3GNT3 expression is associated with poor prognosis of lung cancer patients in TCGA cohort. **(A, B)** B3GNT3 expression levels in 509 lung adenocarcinoma (LUAD) tissues and 20 normal control tissues, or in 475 lung squamous cell carcinoma (LUSC) tissues and 38 normal control tissues were analyzed based on The Cancer Genome Atlas Lung Adenocarcinoma (TCGA-LUAD) and The Cancer Genome Atlas Lung Squamous Cell Carcinoma (TCGA-LUSC) database. **(C, D)** B3GNT3 expression levels in TCGA-LUAD **(C)** or in TCGA-LUSC **(D)** cohort with different TNM stages. **(E, F)** Correlation analysis between the B3GNT3 expression and Ki-67 or PCNA expression in TCGA-LUAD cohort. **(G, H)** Correlation analysis between the B3GNT3 expression and Ki-67 or PCNA expression in TCGA-LUSC cohort. **(I, J)** Kaplan-Meier analysis of overall survival (OS) or disease-free survival (DFS) in TCGA-LUAD **(I)** or TCGA-LUSC cohort with low or high expression levels of B3GNT3. ** $p < 0.01$.

expression in tissue microarray (TMA) containing lung cancer tissues and control tissues. Immunohistochemical staining (IHC) showed that B3GNT3 expression was remarkably enhanced in lung cancer tissue sections (Figure 2A). We established a scoring system for measuring the expression levels of B3GNT3 based on the IHC staining intensity of B3GNT3 (Figure 2B). Lung cancer tissues had markedly higher B3GNT3 staining intensity scores than that in normal tissues (Figure 2C). Moreover, our analysis revealed that B3GNT3 expression was remarkably enhanced in lung cancers with late TNM stages (Figure 2D), bigger tumor size, distant metastasis and recurrence (Figure 2D–G). Consistently, lung cancer patients with high B3GNT3 expression exhibited markedly lower OS and DFS rates than that in lung cancer patients with low level of B3GNT3 in TMA cohort (Figure 2H and I). Taken together, our results suggested that high B3GNT3

expression was associated with unfavorable prognosis in lung cancer patients.

Silencing B3GNT3 Inhibits Lung Cancer Cell Growth and Invasion in vitro

Immunofluorescence staining of B3GNT3, together with DAPI staining, was conducted to reveal the cellular localization of B3GNT3. As shown in Figure 3A, B3GNT3 was mainly distributed in the cytosol of A549 or H1299 cells. To further investigate the function of B3GNT3, we used siRNA targeting B3GNT3 to silence the expression of B3GNT3. B3GNT3 Knockdown was confirmed by Western blot in A549 or H1299 cells (Figure 3B). Functionally, CCK-8 cell proliferation assay demonstrated that knockdown of B3GNT3 markedly inhibited lung cancer cell proliferation in A549 or H1299 cells (Figure 3C and D). In addition,

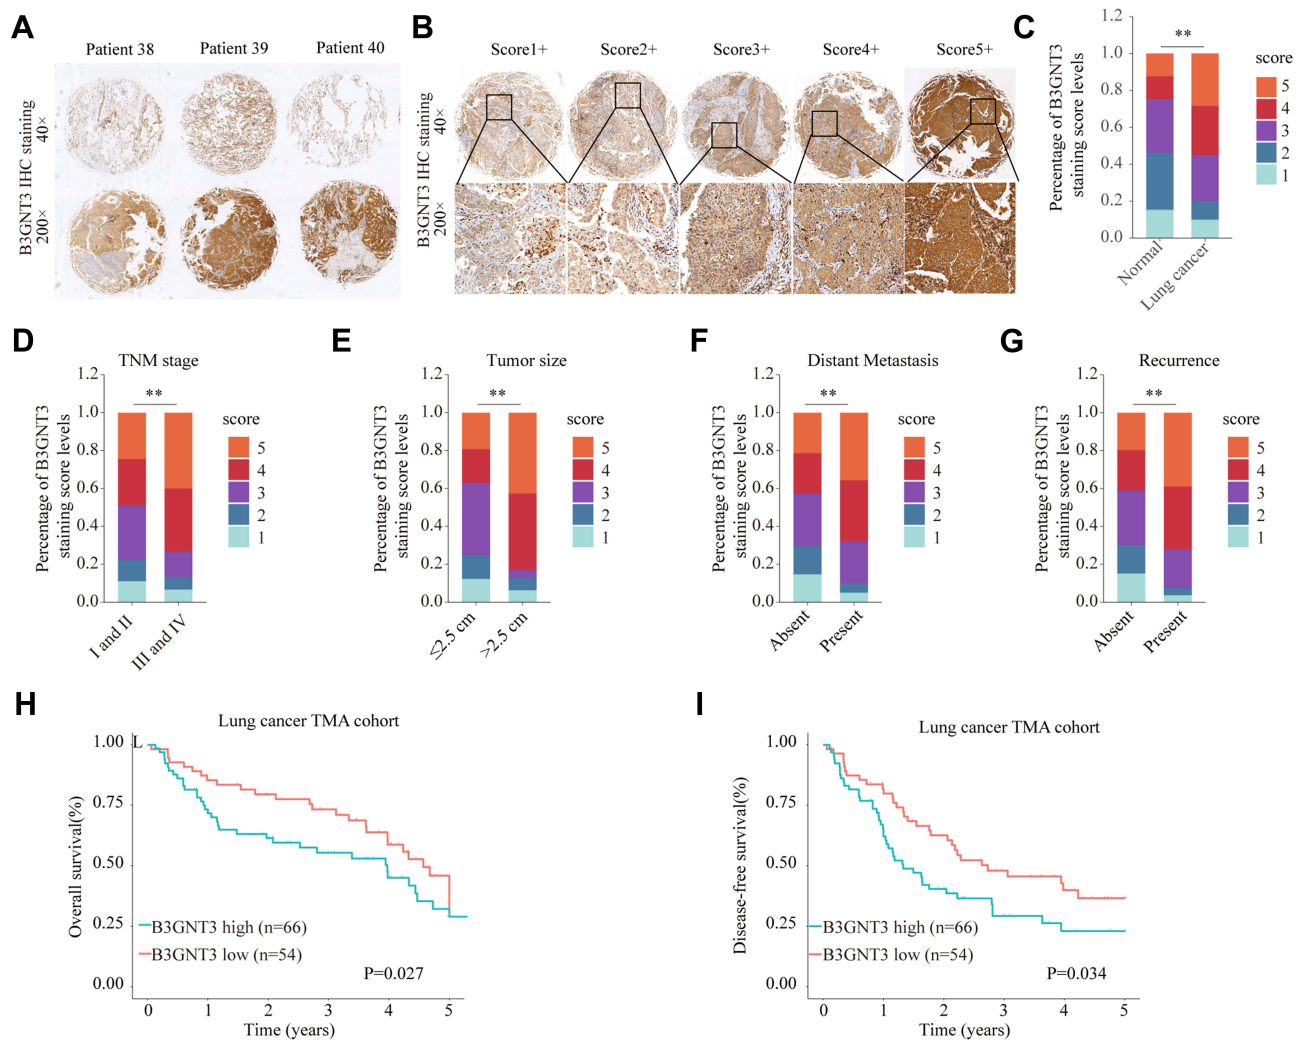

Figure 2 High expression level of B3GNT3 is correlated with advanced lung cancer stages and poor prognosis in TMA cohort. **(A)** Representative B3GNT3 immunohistochemical (IHC) staining of lung cancer tissues from lung cancer patients. **(B)** Representative B3GNT3 IHC staining with different staining intensity scores in lung cancers and adjacent normal tissues. **(C)** Distribution of B3GNT3 staining scores in lung cancers and adjacent normal tissues. **(D)** Distribution of B3GNT3 staining scores in lung cancers with different TNM stages. **(E)** Distribution of B3GNT3 staining scores in lung cancers with different tumor size. **(F)** Distribution of B3GNT3 staining scores in lung cancers with or without distant metastasis. **(G)** Distribution of B3GNT3 staining scores in lung cancers with or without recurrence. **(H, I)** Kaplan-Meier analysis of OS **(H)** or DFS **(I)** in lung cancer TMA cohort with low or high expression levels of B3GNT3. ** $p < 0.01$.

knockdown of B3GNT3 showed markedly decreased colony formation and DNA synthesis in lung cancer cells (Figure 3E and F). Furthermore, cell invasive ability of lung cancer cell A549 or H1299 was significantly impeded by B3GNT3 knockdown (Figure 3G). Collectively, our findings indicated that B3GNT3 knockdown suppressed lung cancer cell growth and invasion in vitro.

Knockdown of B3GNT3 Suppresses Lung Cancer Development in vivo

To dissect the role of B3GNT3 in vivo, A549 cells with stable B3GNT3 knockdown or control cells were injected into nude mice subcutaneously to establish xenograft lung tumor model. Knockdown of B3GNT3 significantly impeded the lung

tumor growth, with much smaller size and less tumor weight in sh-B3GNT3 group compared with that in sh-NC group (Figure 4A–4D). Moreover, we analyzed the B3GNT3 and proliferation marker Ki-67 expression in tumor sections by IHC staining. While B3GNT3 expression was markedly lower in sh-B3GNT3 group, Ki-67 expression was also significantly decreased after B3GNT3 knockdown (Figure 4E and F). In summary, B3GNT3 knockdown could suppress lung cancer development in vivo.

B3GNT3 Is Negatively Regulated by miR-149-5p

To understand how B3GNT3 expression is regulated in lung cancer, we conducted bioinformatics analysis to seek

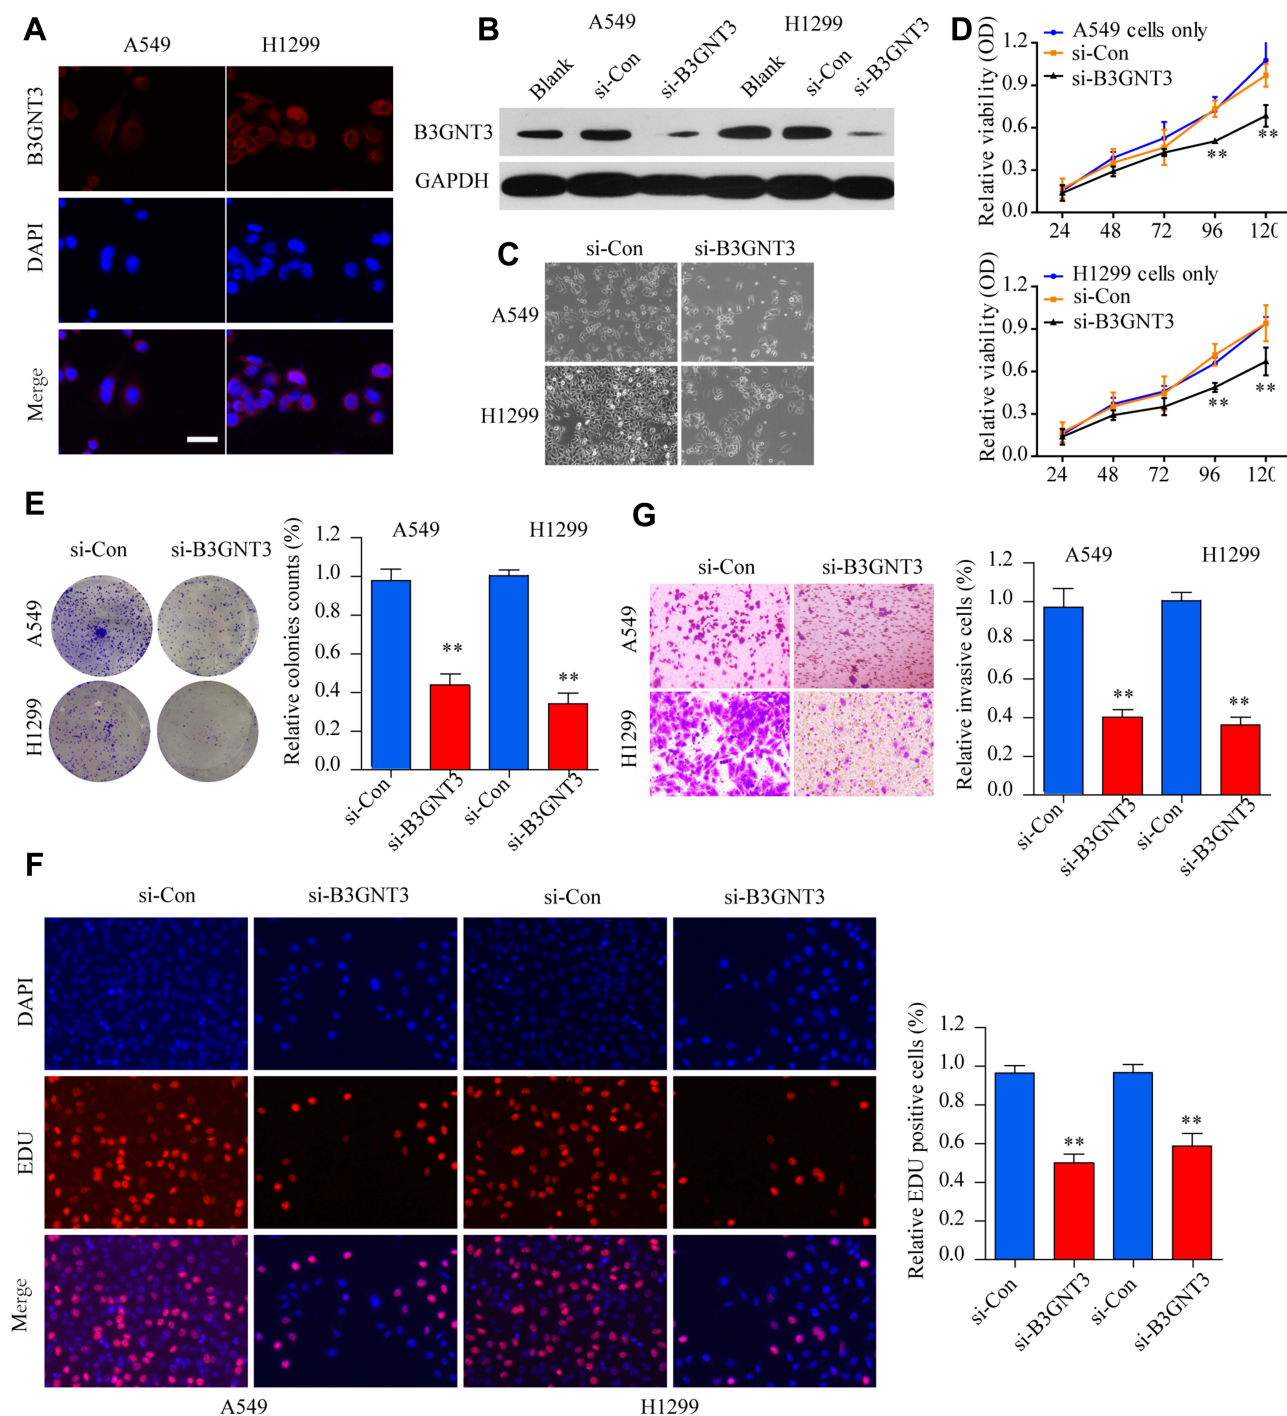

Figure 3 Knockdown of B3GNT3 inhibits lung cancer cell growth and invasion in vitro. **(A)** Immunofluorescence staining of B3GNT3 and DAPI in lung cancer cell A549 and H1299. A549 or H1299 cells were left untreated (blank) or transfected with control siRNA (si-Con) or siRNA targeting B3GNT3 (si-B3GNT3). **(B)** The knockdown efficiency of B3GNT3 was evaluated by Western blot. **(C)** The cell morphology and density of A549 or H1299 transfected with si-Con or si-B3GNT3 were examined by microscope. **(D)** Cell viability of A549 or H1299 transfected with si-Con or si-B3GNT3 was analyzed by CCK-8 assay. **(E)** Colony formation ability of A549 or H1299 cells transfected with si-Con or si-B3GNT3 was analyzed by colony formation assay. **(F)** DNA synthesis in A549 or H1299 cells transfected with si-Con or si-B3GNT3 was analyzed by EDU staining. **(G)** Cell invasion ability of A549 or H1299 cells transfected with si-Con or si-B3GNT3 was analyzed by transwell assay. ** $p < 0.01$.

for the miRNAs targeting B3GNT3. MiR-149-5p was predicted to have the complementary binding sequences against 3'-UTR of B3GNT3 (Figure 5A). MiR-149-5p was demonstrated to have dual roles in tumor, function as

either tumor suppressor or oncogene.²³ MiR-149-5p expression profile was analyzed in lung cancer tissue and control tissues and the result exhibited that lung cancer tissues had significantly lower levels of miR-149-4p

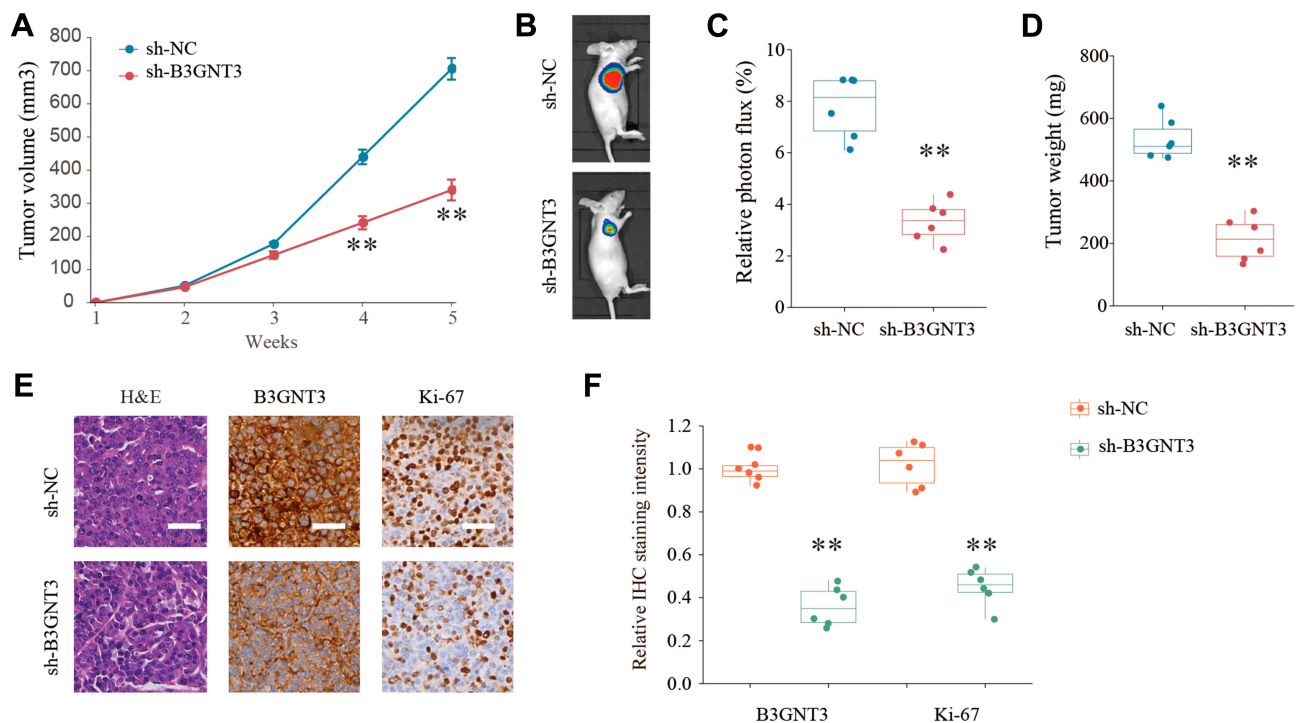

Figure 4 Knockdown of B3GNT3 suppresses lung cancer development in vivo. **(A)** Lung cancer cells A549 transfected with negative control (sh-NC) or sh-B3GNT3 were implanted subcutaneously into nude mice and the tumor growth was monitored and measured at indicated time points. **(B, C)** Representative luciferase photographs and relative photon flux of nude mice and lung tumor tissues from sh-NC and sh-B3GNT3 groups at week 5. **(D)** Tumor weight in nude mice of sh-NC or sh-B3GNT3 group was analyzed. **(E)** Representative H&E staining and IHC staining of B3GNT3 and Ki-67 of tumor sections from sh-NC or sh-B3GNT3 group. (Figure 5B). Intriguingly, Pearson correlation analysis revealed that B3GNT3 expression was negatively associated with miR-149-5p expression (Figure 5C). We further confirmed the regulation between B3GNT3 and miR-149-5p via luciferase reporter assay. MiR-149-5p mimics specifically suppressed the luciferase activity in HEK293 with luciferase reporter vector containing WT 3'-UTR of B3GNT3, but not with mutated 3'-UTR of B3GNT3 (Figure 5D). Moreover, we demonstrated that miR-149-5p overexpression dampened B3GNT3 expression, while inhibition of miR-149-5p enhanced B3GNT3 expression (Figure 5E–G). These results suggested that miR-149-5p might suppress the expression of B3GNT3 via binding to 3'-UTR of B3GNT3.

MiR-149-5p Antagonizes the Tumorigenesis Effect of B3GNT3 in vitro

To further evaluate miR-149-5p/B3GNT3 axis in regulating lung cancer tumor progression, A549 or H1299 cells were transfected with control vector, miR-149-5p mimics, pcDNA3.1-B3GNT3, or miR-149-5p mimics+pcDNA3.1-B3GNT3. Overexpression miR-149-5p suppressed cell

growth and B3GNT3 overexpression enhanced cell proliferation in A549 or H1299 cells (Figure 6A and B). MiR-149-5p mimics abrogated the promotion of cell proliferation induced by B3GNT3 overexpression (Figure 6A and B). Further, transwell experiments showed that B3GNT3 overexpression enhanced cell invasion while miR-149-5p mimics reversed the tumorigenesis effect of B3GNT3 overexpression in A549 cells (Figure 6C). Consistently, we demonstrated miR-149-5p mimics inhibited B3GNT3 expression in A549 or H1299 cells, and overexpression B3GNT3 together with miR-149-5p mimics transfection partially rescued B3GNT3 expression (Figure 6D). Collectively, our data supported that miR-149-5p antagonized the tumorigenesis effect of B3GNT3 in vitro.

Discussion

B3GNT3 is constitutively expressed in various normal tissues including stomach, small intestine, colon and placenta.⁴ The function of B3GNT3 has been studied in the regulation of tumorigenesis in multiple cancers, such as neuroblastoma, pancreatic cancer, cervical cancer, and non-small cell lung cancer.^{7,9–12} While B3GNT3 expression is highly upregulated in most of malignant tumors and

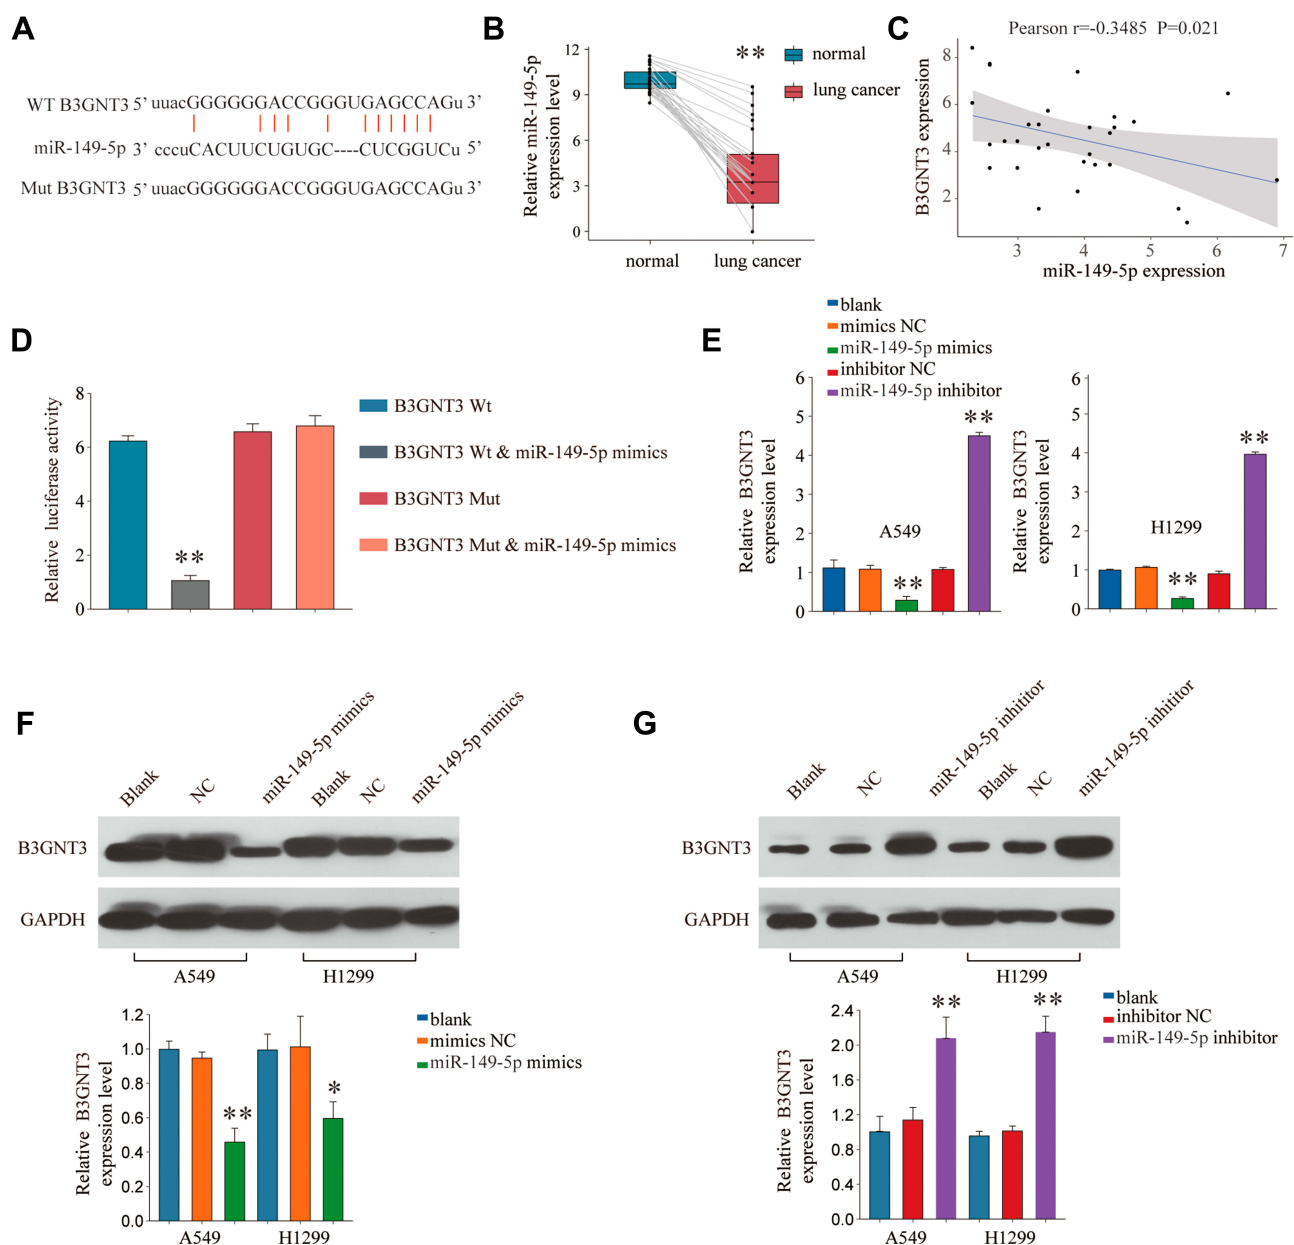

Figure 5 B3GNT3 is a direct target of miR-149-5p. **(A)** Putative binding sequences of miR-149-5p on the 3'-UTR of B3GNT3 and the mutated sequences of 3'-UTR of B3GNT3. **(B)** The expression levels of miR-149-5p in lung cancer or control normal tissues were analyzed by qRT-PCR. **(C)** Pearson correlation analysis of miR-149-5p expression and B3GNT3 expression in lung cancer tissues. **(D)** Luciferase reporter vector containing WT 3'-UTR of B3GNT3 or mutated 3'-UTR of B3GNT3 were co-transfected with miR-149-5p mimics into HEK293 cells. associated with tumor progression, malignant transformation, and metastasis,^{8,24,25} B3GNT3 was also reported to suppress the metastasis of neuroblastoma cells and predict favorable outcomes.⁹ In this study, we revealed the over-expression pattern of B3GNT3 in lung cancers by both bioinformatics analyzing TCGA lung cancer cohort and IHC analyzing lung cancer tissue microarray. Moreover,

we verified that upregulated expression of B3GNT3 was correlated with unfavorable prognosis in lung cancer.

Our results revealed that silencing B3GNT3 inhibited lung cancer cell growth and invasion in vitro, and impeded lung tumor development in xenograft tumor model in vivo. Though the underlying mechanisms by which B3GNT3 promoted lung cancer development was not clear, previous studies

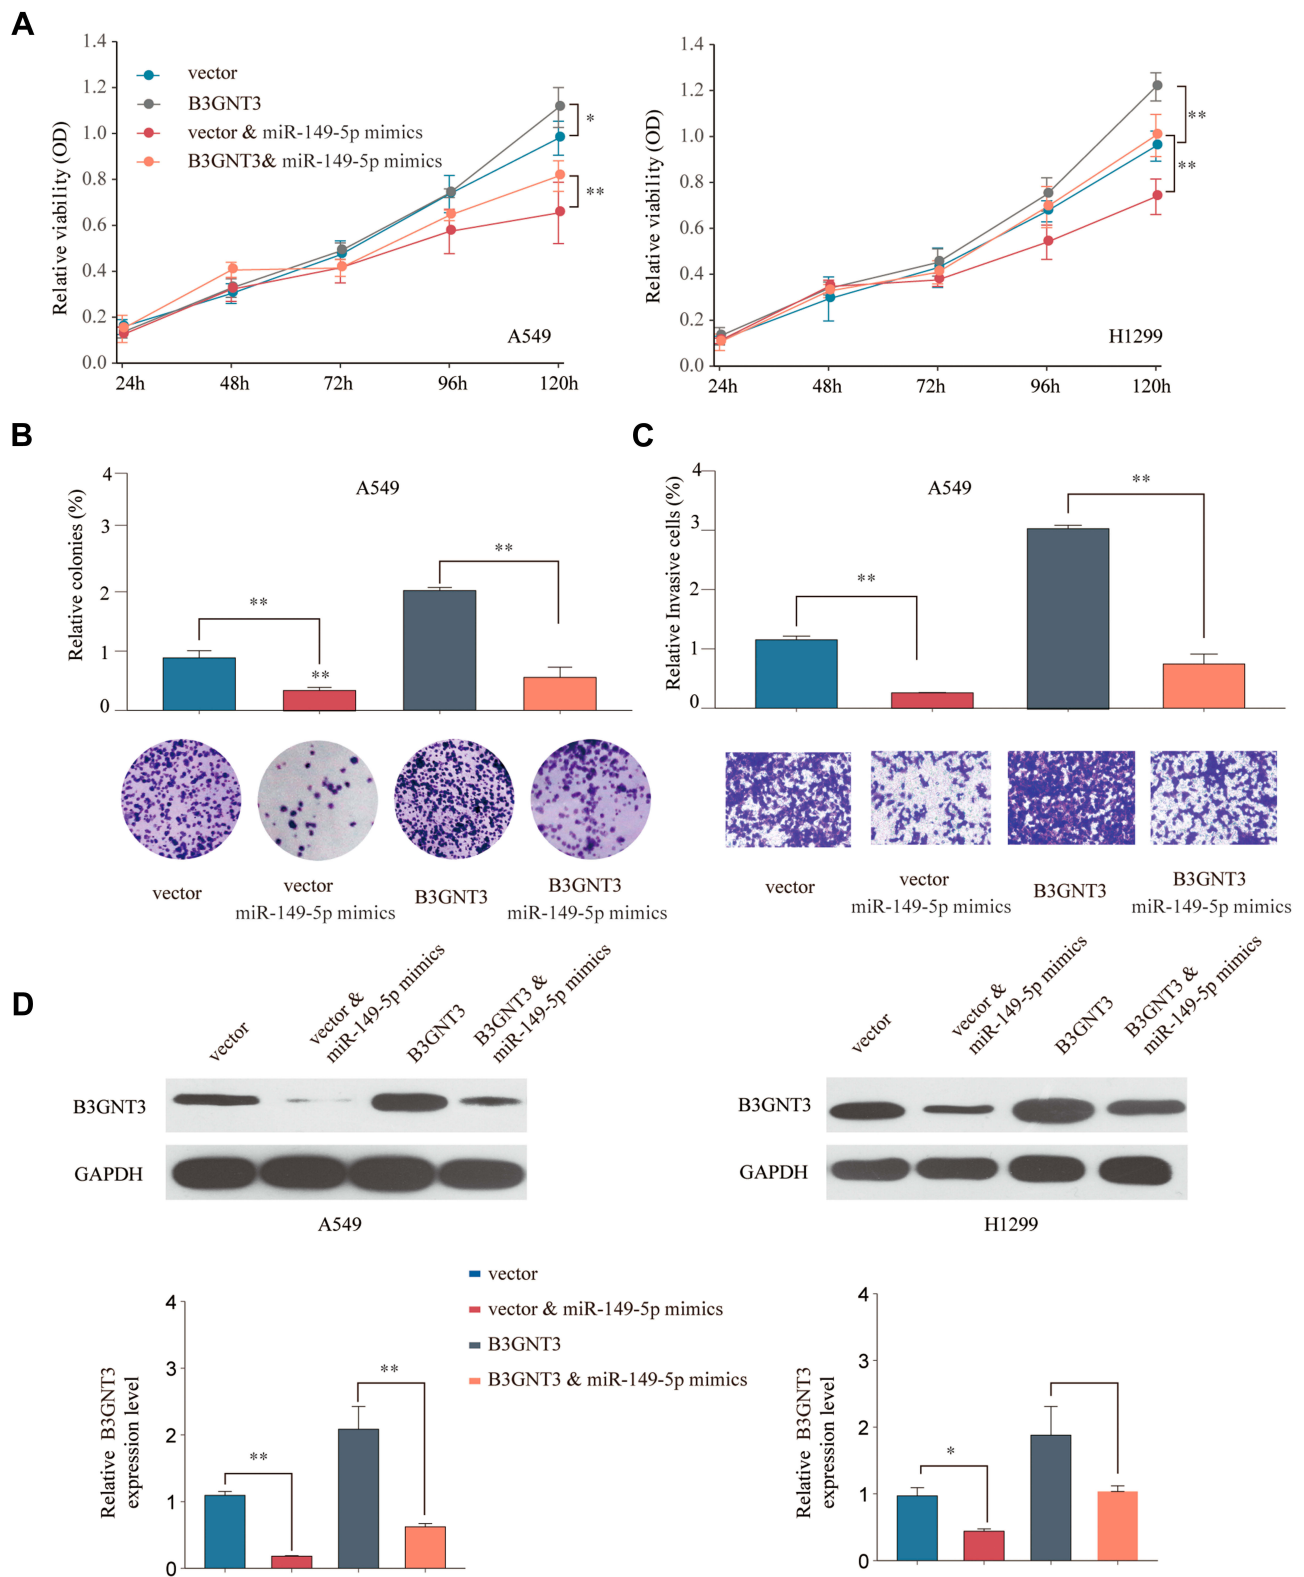

Figure 6 MiR-149-5p antagonizes the tumorigenesis effect of B3GNT3 in vitro. A549 or H1299 cells were transfected with pcDNA3.1 (vector control), pcDNA3.1-B3GNT3 (B3GNT3), pcDNA3.1 vector + miR-149-5p mimics, or pcDNA3.1-B3GNT3 + miR-149-5p mimics. **(A)** Cell viability of A549 or H1299 was analyzed by CCK-8 assay at indicated time points. **(B)** Colony formation ability of A549 cells was analyzed by colony formation assay. **(C)** Cell invasion ability of A549 cells transfected was analyzed by transwell assay. **(D)** The protein expression of B3GNT3 in A549 or H1299 cells was analyzed by Western blot. * $p < 0.05$, ** $p < 0.01$.

indicated that B3GNT3 regulated the biosynthesis of L-selectin ligand and affected cancer cell trafficking.²⁶ Other studies showed that B3GNT3 could catalyze PD-L1 glycosylation and enhance the immune checkpoint therapy in triple-negative breast cancer.²⁷ These results indicated that B3GNT3 might have different roles and complicated function in tumor progression and prognosis, which needs further investigation.

We further identified miR-149-5p negatively regulated B3GNT3 expression by binding to its 3'-UTR. MiR-149-5p was upregulated in prostate cancer, acute myeloid leukemia, and glioblastoma.^{28–30} Other studies demonstrated miR-149-5p functioned as tumor suppressor and was downregulated in gastric cancer, hepatocellular carcinoma and neuroblastoma.^{31–33} Ke et al showed that miR-149 suppressed lung cancer cell EMT via targeting FOXM1.³⁴ In the current study, we identified that miR-149-5p was lower expressed in lung cancer than that in normal tissues and B3GNT3 expression was negatively correlated with the expression of miR-149-5p. Previous studies have reported that miR-149-5p regulated AKT1/mTOR signaling pathway and was sponged by circular RNA circNRIP1.³⁵ Rui-Da Xu et al demonstrated that miR-149-5p directly regulated TNFRSF12A and inhibited human osteosarcoma development via regulating TWEAK/Fn14/PI3K/AKT pathway.³⁶ Due to the complicated regulatory mechanisms of miRNA, miR-149-5p could have multiple targets involved in the regulation of lung cancer development and progression.

There are several limitations in our study that should be addressed in the future study. First, the underlying mechanism and signaling pathway by which B3GNT3 regulates lung cancer cell proliferation and invasion was not elucidated. Second, whether B3GNT3 is controlled by other miRNAs or whether miR-149-5p functions solely through negatively regulating B3GNT3 needs further clarification. In addition, it is worthwhile to further investigate the potential value of B3GNT3 as a prognosis biomarker.

In summary, for the first time, we have demonstrated that B3GNT3 is significantly upregulated in lung cancer both at mRNA and protein levels, and miR-149-5p negatively regulates B3GNT3 expression and suppresses lung cancer development. Thus, miR-149-5p/B3GNT3 axis might be further explored as a promising prognosis biomarker and therapeutic strategy in lung cancer.

Cancer Management and Research

Publish your work in this journal

Cancer Management and Research is an international, peer-reviewed open access journal focusing on cancer research and the optimal use of preventative and integrated treatment interventions to achieve improved outcomes, enhanced survival and quality of life for the cancer patient.

Submit your manuscript here: <https://www.dovepress.com/cancer-management-and-research-journal>

Dovepress

The manuscript management system is completely online and includes a very quick and fair peer-review system, which is all easy to use. Visit <http://www.dovepress.com/testimonials.php> to read real quotes from published authors.
