327. Assessment of Bacterial Co-infection Rates and Antibiotic Exposure in COVID-19 Patients

Adam J. Luetkemeyer, PharmD¹; Nick Bennett, PharmD²; Laura Aragon, PharmD²; Jeannette Ploetz, PharmD²; Sarah E. Boyd, MD²; ¹Saint Luke's Hospital, Kansas City, Missouri; ²Saint Luke's Health System, Kansas City, Missouri

Session: P-14. COVID-19 Complications, Co-infections, and Clinical Outcomes

Background. COVID-19 pandemic data suggest risk for bacterial co-infection upon hospital presentation remain extremely low. Despite low co-infection rates, antibiotics are prescribed for most patients. Current data are limited regarding institutional-specific change in antibiotic use over the course of the pandemic. Given the low rates of co-infections, Saint Luke's Health System's COVID-19 Treatment Taskforce developed a COVID-19 evaluation and treatment order set which included procalcitonin (PCT). As co-infection literature emerged, active education was provided, and order sets were modified to provide passive education regarding co-infection rates. We aimed to assess antibiotic practice changes as data and strategies to influence use evolved during the pandemic.

Methods. This was a multi-center, single health-system retrospective cohort study. Ten community hospitals and 1 academic medical center were included in analysis. Inclusion criteria were age \geq 18 years, admitted during April or September 2020 and had a positive COVID-19 result on admission. Patients were excluded if they were readmitted for COVID-19 related issues. Both primary and secondary outcomes were analyzed from the first 7 days after admission. The primary outcome was rate of respiratory bacterial co-infections. This was determined through sputum and blood cultures, urinary antigens including *Streptococcus pneumoniae* and Legionella, and PCT. Secondary outcomes included rate of antibiotic use, antibiotic days of therapy (DOT), length of therapy, and antibiotic use trends.

Baseline Characteristics

Table 1-Baseline Characteristics and Inpatient Laboratory Results

	Total	Month		
	n = 294	April n = 69	September n = 225	P-Value
Age	65.4±17.6	66.4 ± 15.7	65.1±18.2	0.587
Sex Female	131 (44.6%)	131 (44.6%) 26 (37.7%) 105 (46.7%)		0.188
BMI (kg/m²)	31.3 ± 12.0	29.8±8.2	31.8 ± 13.0	0.236
Charlson Co-morbidity Index	4.0 (2.0, 6.0)	4.0 (2.0, 5.0)	4.0 (2.0, 6.0)	0.622
Hospital Length of Stay (days)	6.0 (3.0, 9.0)	7.0 (4.0, 13.0)	5.0 (3.0, 8.0)	0.010
Average Serum Creatinine (mgldL)	0.9 (0.7, 1.3)	0.9 (0.7, 1.3) 1.0 (0.8, 1.5) 0.9 (0.7, 1.3)		0.047
Creatine Clearance (mL/min)	72.4 (41.3, 107.5)	72.4 (41.3, 107.5) 72.4 (34.1, 89.8) 72.3 (41.8, 111.8)		0.192
White blood cells	8.1 (6.0, 10.9)	8.1 (8.0, 10.9) 7.3 (5.4, 10.2) 8.4 (6.1, 11.1)		0.067
Admission Procalcitonin	0.1 (0.0, 0.3)	0.2 (0.1, 0.8)	0.1 (0.0, 0.2)	0.014
Streptococcus Pneumoniae Urino Antigen	4 (2.1%)	4 (2.1%) 1 (2.2%) 3 (2.0%)		0.955
Legionella Urine Antigen Positive Negative Not Tested	2 (0.7%) 292 (99.3%)			0.431
Clostridioldes difficile Positivo Negative Not Tested	5 (19.2%) 21 (80.8%) 268	21 (80.8%) 13 (92.9%) 8 (66.7%)		0.091
Gastrointestinal Panel Positive Negative Not Testod	2 (8.3%) 22 (91.7%) 270	22 (91.7%) 11 (100.0%) 11 (84.6%)		0.174
Sputum Culture Positive Negative Not Tostod	10 (55.6%) 8 (44.4%) 276			1.000
Urine Culture Positive Negative Not Tested	28 (39.4%) 43 (60.6%) 223	(60.6%) 15 (78.9%) 28 (53.8%)		0.055
Wound Culture Positivo Negative Not Tested	1 (33.3%) 2 (66.7%) 291			0.083
Blood Cultures Positive Negative			19(14.4%) 113(85.6%)	0.907

Results. A total of 294 patients were included with 69 patients in April 2020 and 225 in September 2020. Primary and secondary results are shown in Table 2. Rate of culture-confirmed bacterial co-infection when examining April 2020 was 4.38% and 4.44 % in September 2020. Antibiotic uses, antibiotic DOT, and length of therapy were all significantly lower in September 2020 compared to April 2020.

Table 2- Primary and Secondary Outcomes

	Total Mo		
n = 294	April n = 69	September n = 225	P-Value
13 (4.42%) 31 (10.5%)	3 (4.38%) 9 (13.0%)	10 (4.44%) 22 (9.8%)	0.439
224 (76.2%)	63 (91.3%)	161 (71.6%)	< 0.001
3.0 (1.0, 5.0)	4.0 (2.0, 6.0)	3.0 (0.0, 5.0)	0.001 W
5.0 (1.0, 8.0)	6.0 (4.0, 9.0)	4.0 (0.0, 7.0)	< 0.001 W
	13 (4.42%) 31 (10.5%) 224 (76.2%) 3.0 (1.0, 5.0)	n = 294 n = 69 13 (4,42%) 3 (4.38%) 31 (10.5%) 9 (13.0%) 224 (76.2%) 63 (91.3%) 3.0 (1.0, 5.0) 4.0 (2.0, 6.0)	$\label{eq:response} \begin{array}{c c c c c c c c c c c c c c c c c c c $

Conclusion. Our results show bacterial co-infections were extremely low in our health system. Despite positive trends in antibiotic use, prescribing remained high. More targeted interventions to decrease antibiotic exposure in COVID-19 patients are needed.

328. Bacteremia in Patients Hospitalized with Covid-19 Disease, Risk Factors, Impact of immunomodulator Therapy, Role of Inflammatory Markers, Antibiotic Use, and Outcomes: A Single Center Retrospective Study

Aleena Zahra, MD¹; Bettina C. Fries, MD/FIDSA²; Bettina C. Fries, MD/FIDSA²; ¹SUNY Stony Brook University Hospital, Stony Brook, New York ²Stony Brook University Hospital, Stony Brook, NY

Session: P-14. COVID-19 Complications, Co-infections, and Clinical Outcomes

Background. Novel coronavirus 2019 (Covid19) caused by SARS-CoV2 can lead to significant morbidity and mortality. There is unclear association between Covid19 and bacteremia. Patient characteristics and outcomes are not well defined. This retrospective cohort study assessed this in patients with Covid19 and bacteremia.

Methods. Patients with Covid-19 admitted to a tertiary care suburban academic medical center (UH) were assessed retrospectively by EMR chart review for co-morbidities, pre and in hospital factors, and outcomes as defined below. Bacteremias grouped into gram-negative or gram-positive with collation of each unique bacterial species (Table 1).
