In the title compound, diaquabis(ethylenediamine- $\kappa^2 N,N'$)copper(II) bis(2-nitrobenzoate), $[Cu(C_2H_8N_2)_2(H_2O)_2](C_7H_4NO_4)_2$, two diaquabis(ethylenediamine)copper(II) cations and four nitrobenzoate anions are present in the asymmetric unit. All four anions are ‘whole-molecule’ disordered over two sets of sites. The major components have refined occupancies of 0.572 (13), 0.591 (9), 0.601 (9) and 0.794 (10). The Cu^{II} ions exhibit slightly distorted octahedral geometries. In the crystal, cations and anions are connected to each other via N—H···O and O—H···O hydrogen bonds, forming a two-dimensional network parallel to (200). The intermolecular contacts in the crystal were further analysed using Hirshfeld surface analysis, which indicates that the most significant contacts are O···H/H···O (42.9%), followed by H···H (35.7%), C···H/H···C (14.2%), C···C (2.9%), C···O/O···C (2.2%), N···H/H···N (0.9%) and N···O/O···N (0.3%).

1. Chemical context

Carboxylates are employed in the synthesis of new transition-metal complexes because they can stabilize them and additionally display different coordination modes such as monodentate, bidentate, bridging (*syn-syn*, *syn-anti* or *anti-anti* mode) and ionic. Copper(II) carboxylates have been used as single precursors for the preparation of copper(II) oxide nanoparticles (Karthik & Qadir, 2019). Copper(II) complexes containing ethylenediamine derivatives and carboxylate have shown antibacterial activity against pathogenic bacteria (Kumar *et al.*, 2013). It has been reported that some copper(II) carboxylate complexes involving nitrogen donor ligands exhibit carbonic anhydrase inhibitory activity (Dilek *et al.*, 2017). Ethylenediamine has good coordination and chelating ability, forming five-membered ring compounds with metal centers. Generally, these metallacycles display a twist conformation. Copper can take part in different biological processes. Thus, copper shows an important role in electron transfer, oxidation, and dioxygen transport (Mirica *et al.*, 2004; Rosenzweig *et al.*, 2006). In this paper, we report the synthesis, single crystal structure determination and Hirshfeld surface analysis of a copper(II) complex containing ethylenediamine and 2-nitrobenzoate.

OPEN ACCESS

2. Structural commentary

The asymmetric unit of title compound is shown in Fig. 1 and selected geometric parameters are given in Table 1. There are two independent bis(ethylenediamine- κ^2N)diaqua copper(II) cations and four 2-nitrobenzoate anions. In both cations, the Cu^{II} ion is coordinated by four N atoms of the ethylenediamine ligands which chelate the metal in the equatorial plane, and two axially coordinated water molecules forming a slightly distorted octahedral geometry. The Cu—N bond lengths range from 1.991 (6) and 2.050 (5) Å (Table 1) and are similar to those observed in the structures containing [Cu(en)₂(H₂O)₂]²⁺ cations (Kovbasyuk *et al.*, 1997; Gumienna-Kontecka *et al.*, 2007; Şen *et al.*, 2017). The axial Cu—O contacts in both conformers [2.599 (5) and 2.621 (5) Å for Cu1A and 2.557 (5) and 2.564 (5) Å for Cu1B] are noticeably longer than the equatorial Cu—N distances (Table 1) as a consequence of the Jahn–Teller effect (Kovbasyuk *et al.*, 1997). It is notable that although the complex cations are crystallographically non-centrosymmetric, the Cu—O bond lengths are very similar. In addition, the distances involving Cu1A and O are somewhat longer than for Cu1B. The N—O bond lengths [ranging from 1.223 (11) to 1.251 (15) Å] in the nitro group are close to the values observed for related compounds reported in the literature (Boulhaoua *et al.*, 2019; Kansiz *et al.*, 2018, 2019).

3. Supramolecular features

The crystal structure displays an extensive hydrogen-bonding network (Table 2). The crystal packing of the title compound (Fig. 2) features N—H···O and O—H···O hydrogen bonds, which connect the cations and anions, forming layers parallel to (200). All four water ligands are involved in intermolecular hydrogen bonds. In addition, there are π — π stacking inter-

Displacement ellipsoids are drawn at the 50% probability level [symmetry codes: (i) $x, 1 - y, -\frac{1}{2} + z$; (ii) $x, -y, \frac{1}{2} + z$; (iii) $\frac{1}{2} + x, \frac{1}{2} - y, \frac{1}{2} + z$].

$\frac{1}{2} + z$). These interactions consolidate the three-dimensional structure (Fig. 2).

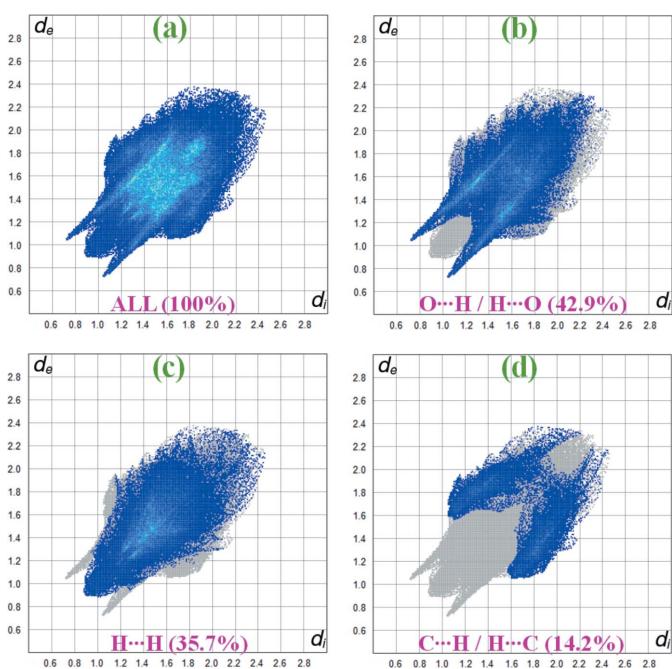

4. Hirshfeld surface analysis

In order to visualize the intermolecular interactions in the crystal of the title compound, Hirshfeld surface analysis (Hirshfeld, 1977) was carried out by using *CrystalExplorer17.5* (Turner *et al.*, 2017). The Hirshfeld surface of the title complex plotted over d_{norm} is shown in Fig. 3 where the N—H···O and O—H···O hydrogen bonds are indicated by red spots. Selected two-dimensional fingerprint plots are shown in Fig. 4 for all contacts as well as individual O···H/H···O, H···H and

C···H/H···C contacts, whose percentage contribution is also given. The small percentage contributions from the other different interatomic contacts to the Hirshfeld surface are as

**Figure 3**

View of the Hirshfeld surface mapped over d_{norm} in the range -0.6381 to $+1.2243$ (arbitrary units).

**Figure 4**

follows: C···C (2.9%), C···O/O···C (2.2%), N···H/H···N (0.9%) and N···O/O···N (0.3%).

5. Database survey

A search of the Cambridge Structural Database (CSD, version 5.40, update of February 2019; Groom *et al.*, 2016) for the title complex revealed two similar structures: diaquabis(ethane-1,2-diamine)copper(II) 5-chloro-2-nitrobenzoate dihydrate (JUMGOP; Saini *et al.*, 2015) and *trans*-diaqua(1,3-diaminopropane)copper(II) 2-nitrobenzoate (WIFRUY; Sundberg & Klinga, 1994). Both complexes have an octahedral coordination geometry at the metal center and the Cu—N and Cu—O bond lengths in these structures are comparable to those in the title compound.

6. Synthesis and crystallization

An aqueous solution of sodium 2-nitrobenzoate (20 mmol, 3.78 g) was added to an aqueous solution of $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ (10 mmol, 2.5 g) under stirring. The precipitate was filtered, dried and dissolved in a hot methanol solution containing ethylenediamine (20 mmol, 1.2 g) under stirring. The mixture was filtered and single crystals were obtained after slow evaporation for one week.

7. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 3. The C-bound H atoms were positioned geometrically and refined using a riding model, with C—H = 0.95 and 0.99 Å with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for all C-bound H atoms. The N-bound H atoms were located in a difference-Fourier map and refined with N—H = 0.91 Å, and with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{N})$. The H atoms bonded to O atoms (O1W, O2W, O3W and O4W) were located in a difference map and treated as part of a rigid group with oxygen as the pivot atom. All four anions are whole-molecule disordered over two sets of sites. The major components have refined occupancies of 0.572 (13), 0.591 (9), 0.601 (9) and 0.794 (10). The major and minor components of disorder for each anion were constrained using the SAME command in *SHELXL* (Sheldrick, 2015). The SIMU command was used to apply restraints to the displacement parameters of the atoms of the anions.

Acknowledgements

We would like to thank the EPSRC for an equipment grant, which funded the diffractometer at Heriot-Watt University.

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refined as a 2-component inversion twin.
