Received 3 April 2011; accepted 20 April 2011

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.009\text{ \AA}$; R factor = 0.052; wR factor = 0.082; data-to-parameter ratio = 14.2.

The crystal structure of the title compound, $(\text{C}_{16}\text{H}_{13}\text{FN})[\text{Ni}(\text{C}_3\text{S}_5)_2]$, consists of Ni^{III} complex anions and 1-(2-fluorobenzyl)quinolinium (fbq) cations. In the complex anion, the Ni^{III} cation is chelated by two 2-sulfanylidene-1,3-dithiole-4,5-dithiolate (dmit) dianions in a distorted square-planar geometry; the two dmit mean planes are twisted with respect to each other at a dihedral angle of $8.44(3)^\circ$. In the fbq cation, the dihedral angle between the benzene ring and the quinoline ring system is $80.57(14)^\circ$. The centroid–centroid distance of $3.860(5)\text{ \AA}$ between benzene rings indicates $\pi-\pi$ stacking between adjacent fbq cations. The distance of $3.4958(18)\text{ \AA}$ between the S atom and the centroid of the pyridine ring suggests the existence of a lone-pair–aromatic interaction between the anion and the cation. A short $\text{S}\cdots\text{S}$ contact [$3.387(2)\text{ \AA}$] is also observed in the crystal structure.

1-(2-Fluorobenzyl)quinolinium bis(2-sulfanylidene-1,3-dithiole-4,5-dithiolato- κ^2S,S')nickelate(III)

W.-W. Shan, P. Zhang and X.-Y. Hu

Comment

The bis(dithiolate)-metal complexes and their analogues with interesting structures and/or potential applications such as conducting/magnetic or non-linear optical (NLO) materials have been reported in recent years (Cassoux, 1999). We report herein the crystal structure of the title bis-dithiolate-metal complex.

In this compound, the Ni^{II} cations of NiCl₂.6H₂O have been oxidized to Ni^{III} cation by I₂ (Cassoux *et al.*, 1991), the Ni^{III} cation is coordinated with two dmit^{II} anions. As shown in Fig. 1, the asymmetric unit of the title compound contains one [Ni^{III}(dmit)₂]⁻ anion and one [Fbzql]⁺ cation. Each Ni^{III} ion is coordinated by four S atoms from two dmit ligands to complete a square-planar geometry, with Ni—S bond lengths ranging from 2.1502 (14) to 2.1595 (14) Å. Some of the [Ni^{III}(dmit)₂]⁻ anions are parallel and coplanar arrangements with the shortest S···S distance of 3.387 (2) Å (S3—S8ⁱ) [symmetry code: (i) $x, y, -1 + z$], indicating the existence of the S···S interactions. Adjacent [Ni^{III}(dmit)₂]⁻ anions are associated together through such S···S interactions result in a one-dimensional ribbon structure running along the *c*-axis. Two neighbouring anion ribbons are parallel each other and linked together through S6···S8ⁱⁱ [symmetry code: (ii) $1 - x, -y, 2 - z$] interactions forming a double-chain which is further connected to other four anion double-chains through S···S contacts [S2···S2ⁱⁱⁱ: 3.519 (3) Å, S9···S9^{iv}: 3.568 (2) Å [symmetry codes: (iii) $-x, -y, 1 - z$; (iv) $1 - x, 1 - y, 2 - z$] along four orientations to form a three-dimensional supramolecular structure with large channels, as depicted in Fig 2.

Two [Fbzql]⁺ cations are associated together through face-to-face π ··· π interactions between two phenyl rings from different 2-fluorobenzyl groups (inter-centeroid distance: 3.8501 (9) Å) to form a bi-molecular unit, which expended to a one-dimensional structure running along the *c*-axis through another π ··· π interaction involving adjacent quinoline groups from different bi-molecular units with the shortest interface distance of 3.407 (4) Å.

The voids of the three-dimensional anion supramolecular structure are filled with the cation chains, as shown in Fig 3. Electrostatic attraction between the anions and cations play an important role in the stabilization of the whole structure. Additional investigation of this structure indicates that different noncovalent interactions can be detected between the two kinds of ions. The quinoline group of the [Fbzql]⁺ cation and neighbouring anion planes are parallel and associated together through lp··· π (Egli & Sarkhel, 2007) interactions between one terminal sulfur atom of [Ni^{III}(dmit)₂]⁻ anion and the pyridine ring of the quinoline group [S9^v-centroid distance 3.4958 (18) Å, symmetry codes: (v) $1 - x, 1 - y, 1 - z$]. In addition, the distance between the benzene ring of the quinoline group from [Fbzql]⁺ cation and the terminal π system of adjacent [Ni^{III}(dmit)₂]⁻ anion is about 3.8294 (13) Å, indicating the existence of face-to-face π ··· π interaction which stabilizes the three-dimensional structure.

supplementary materials

Experimental

4,5-Bis(thiobenzoyl)-1,3-dithiole-2-thione (812 mg, 2.0 mmol; Wang *et al.*, 1998) was suspended in dry methanol (20 ml) and sodium (92 mg, 4.0 mmol) was added under a nitrogen atmosphere at room temperature to give a bright-red solution. NiCl₂·6H₂O (238 mg, 1 mmol) was then added, followed successively by I₂ (127 mg, 0.5 mmol) and a solution of *N*-(2-fluorobenzyl)quinolinium chloride (274 mg, 1 mmol) in methanol at an interval of approximately 20 min. The solution was stirred for a further 30 min and the resulting solid collected by filtration. Single crystals of the title compound were obtained by evaporation of a dilute acetone solution over two weeks at room temperature.

Refinement

H atoms were positioned geometrically and refined using a riding model, with C—H = 0.93–0.97 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.052$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.082$	H-atom parameters constrained
$S = 0.99$	$w = 1/[\sigma^2(F_o^2) + (0.P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
4475 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
316 parameters	$\Delta\rho_{\text{max}} = 0.47 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.38 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
