Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$ ;  $R$  factor = 0.030;  $wR$  factor = 0.070; data-to-parameter ratio = 22.2.

The title compound,  $(\text{C}_7\text{H}_8\text{NO})_6[\text{Sb}_4\text{Cl}_{18}]$ , contains centrosymmetric hexaanions built up from four vertex-sharing alternating  $\text{SbCl}_5$  square-based pyramids and highly distorted  $\text{SbCl}_6$  octahedra when long ( $<3.2\text{ \AA}$ ) 'secondary'  $\text{Sb}-\text{Cl}$  interactions are taken into account. The inter-polyhedral  $\text{Sb}-\text{Cl}$  bonds define a square-shape. In the crystal, the components are linked by  $\text{N}-\text{H}\cdots\text{Cl}$ ,  $\text{C}-\text{H}\cdots\text{Cl}$  and  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds, generating a three-dimensional network.

### Hexakis(4-acetylpyridinium) octadecachloridotetraantimonate(III)

#### X. Fu

##### Comment

As a continuation of our study of phase transition materials, including organic ligands (Li *et al.*, 2008), metal-organic coordination compounds (Zhang *et al.*, 2009), organic-inorganic hybrids, we studied the dielectric properties of the title compound, unfortunately, there was no distinct anomaly observed from 93 K to 400 K, (m.p. 421–423 K), suggesting that this compound should be not a real ferroelectrics or there may be no distinct phase transition occurred within the measured temperature range. In this article, the crystal structure of (I) has been presented.

4-Acetylpyridine may be used as a ligand in coordination compounds *e.g.* with Zn (Steffen & Palenik, 1977) or Ni (Pang *et al.*, 1994). The crystal structures of 4-acetylpyridine together with inorganic acids are also known *e.g.* with sulfuric acid (Fu, 2009b) and perchloric acid (Fu, 2009a).

The cell unit of the title compound is made up of six almost planar protonated 4-acetylpyridinium cations and a  $[Sb_4Cl_{18}]^{6-}$  anion (Fig. 1.). In the coordinate anion of  $[Sb_4Cl_{18}]^{6-}$ , antimony(III) atoms have two kinds of coordination pattern.  $Sb^{3+}(2)$  coordinated with five Cl ions construct a distorted tetragonal pyramidal structure, composing two bridging and three terminal Cl atoms. There are Cl—Sb secondary bonds by the linkage between the  $Sb^{3+}(1)\cdots Cl5$  and  $Sb^{3+}(1)\cdots Cl6$ , with the bond lengths of these secondary bonds 3.0210 (11) Å and 3.1280 (11) Å, respectively, compared to the normal coordination bonds of Sb—Cl 2.3516 (12) Å to 2.8937 (11) Å. Owing to these secondary bonds, the coordination number of the central ion  $Sb^{3+}(1)$  increases to six, and it adopts a distorted octahedral geometry.

The tridimensional network arrangement in the crystal structure of (I) is mainly determined by relatively strong and directional hydrogen bonds (Table. 1),

##### Experimental

2.28 g (10 mmol)  $SbCl_3$  was firstly dissolved in 10 ml 1:1 HCl solution, to which 2.42 g (20 mmol) 4-acetylpyridine ethanol solution was then added under stirring. Hydrochloric acid was added until the precipitated substrates disappeared. The acid solution was allowed to slowly evaporate at room temperature until colorless prisms of (I) were grown.

##### Refinement

Positional parameters of all the H atoms were calculated geometrically and were allowed to ride on the C and N atoms to which they are bonded, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ ,

$$U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N}).$$

Hall symbol: -P 1	Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
$a = 9.0589 (18) \text{ \AA}$	Cell parameters from 8056 reflections
$b = 13.838 (3) \text{ \AA}$	$\theta = 3.1\text{--}27.7^\circ$
$c = 15.128 (3) \text{ \AA}$	$\mu = 2.37 \text{ mm}^{-1}$
$\alpha = 108.29 (3)^\circ$	$T = 298 \text{ K}$
$\beta = 98.00 (3)^\circ$	Prism, colourless
$\gamma = 107.10 (3)^\circ$	$0.40 \times 0.30 \times 0.20 \text{ mm}$
$V = 1664.1 (6) \text{ \AA}^3$	

### Data collection

Rigaku SCXmini diffractometer	7613 independent reflections
Radiation source: fine-focus sealed tube graphite	6371 reflections with $I > 2\sigma(I)$
Detector resolution: 13.6612 pixels $\text{mm}^{-1}$	$R_{\text{int}} = 0.028$
$\omega$ scans	$\theta_{\text{max}} = 27.5^\circ, \theta_{\text{min}} = 3.1^\circ$
Absorption correction: multi-scan ( <i>CrystalClear</i> ; Rigaku, 2005)	$h = -11 \rightarrow 11$
$T_{\text{min}} = 0.430, T_{\text{max}} = 0.622$	$k = -17 \rightarrow 17$
17638 measured reflections	$l = -19 \rightarrow 19$

## *Refinement*

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.030$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.070$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0307P)^2 + 0.5066P]$ where $P = (F_o^2 + 2F_c^2)/3$
7613 reflections	$(\Delta/\sigma)_{\max} = 0.001$
343 parameters	$\Delta\rho_{\max} = 0.39 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.38 \text{ e } \text{\AA}^{-3}$

## *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
