## Ethyl 2-amino-4,5-dimethylthiophene-3carboxylate

Mostafa M. Ghorab, ${ }^{\text {a }}$ Mansour S. Al-Said, ${ }^{\text {a }}$ Hazem A. Ghabbour, ${ }^{\text {b }}$ Tze Shyang Chia ${ }^{\text {c }}$ and Hoong-Kun Fun ${ }^{\text {c* }} \ddagger$<br>${ }^{\text {a }}$ Medicinal, Aromatic and Poisonous Plants Research Center (MAPPRC), College of Pharmacy, King Saud University, PO Box 2457, Riyadh 11451, Saudi Arabia, ${ }^{\mathbf{b}}$ Department of Pharmaceutical Chemistry, College of Pharmacy, King Saud University, PO Box 2457, Riyadh 11451, Saudi Arabia, and ${ }^{\text {c }}$ X-ray Crystallography Unit, School of Physics, Universiti Sains Malaysia, 11800 USM, Penang, Malaysia Correspondence e-mail: hkfun@usm.my

Received 10 June 2012; accepted 10 June 2012

Key indicators: single-crystal X-ray study; $T=296 \mathrm{~K}$; mean $\sigma(\mathrm{C}-\mathrm{C})=0.002 \AA$; $R$ factor $=0.037 ; ~ w R$ factor $=0.104$; data-to-parameter ratio $=12.7$.

In the title compound, $\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{2} \mathrm{~S}$, the mean planes of thiophene ring [maximum deviation $=0.0042$ (10) $\AA$ ] and ethoxycarbonyl group $[0.0242(15) \AA$ ] are almost coplanar [dihedral angle between them $=0.68(11)^{\circ}$ ]. The H atoms of the two methyl groups attached to the thiophene ring are each disordered over two orientations with site-occupancy ratios of 0.77 (4):0.23 (4) and 0.84 (4):0.16 (4). An intramolecular N $\mathrm{H} \cdots \mathrm{O}$ hydrogen bond generates an $S(6)$ ring motif. In the crystal, molecules are linked by $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds into an infinite wave-like chain running parallel to the $b$-axis direction. The crystal structure also features $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions.

## Ethyl 2-amino-4,5-dimethylthiophene-3-carboxylate

Mostafa M. Ghorab, Mansour S. Al-Said, Hazem A. Ghabbour, Tze Shyang Chia and Hoong-Kun Fun

## Comment

Ethyl 2-amino-4,5-dimethylthiophene-3-carboxylate (Gewald, 1965) is useful in the synthesis of heterocyclic compounds, especially thienopyrimidine derivatives (Alqasoumi et al., 2009), some of which possess biological activities (Ghorab et al., 2006). In the light of this, and as a continuation of our efforts towards synthesizing biologically active heterocyclic compounds (Ghorab et al., 2012), the title compound was prepared and its crystal structure is now reported.
The molecular structure of the title compound is shown in Fig. 1. The mean plane of thiophene ring [S1/C1-C4; maximum deviation $=0.0042(10) \AA$ at atom $C 4]$ is almost coplanar with the mean plane of ethoxycarbonyl group [O1/O2/C7-C9; maximum deviation $=0.0242(15) \AA$ at atom C 8$]$ as indicated by the dihedral angle of $0.68(11)^{\circ}$. The H atoms attached to atoms C5 and C6 are each disordered over two orientations with site-occupancy ratios of 0.77 (4):0.23 (4) and 0.84 (4):0.16 (4), respectively. An intramolecular N1- $\mathrm{H} 1 \mathrm{~N} 1 \cdots \mathrm{O} 2$ hydrogen bond generates an $\mathrm{S}(6)$ ring motif (Bernstein et al., 1995) in the molecule.

In the crystal (Fig. 2), molecules are linked by $\mathrm{N} 1-\mathrm{H} 2 \mathrm{~N} 1 \cdots \mathrm{O} 2$ hydrogen bond into an infinite wave-like chain, propagating along the $b$ axis. The crystal packing also features $\mathrm{C}-\mathrm{H} \cdots \pi$ interactions (Table 1), involving $C g 1$ which is the centroid of S1/C1-C4 ring.

## Experimental

Ethyl 2-amino-4,5-dimethylthiophene-3-carboxylate was prepared according to the reported method (Gewald, 1965). The obtained solid was recrystallized from ethanol to give the title compound. Brown plates were obtained by slow evaporation from ethanol solution at room temperature.

## Refinement

The atoms H1N1 and H2N1 were located in a difference fourier map and refined freely $[\mathrm{N}-\mathrm{H}=0.88$ (3) and 0.87 (2) $\AA$ ]. The major parts of disordered H atoms attached to atoms C5 and C6 [(H5A, H5B, H5C) and (H6A, H6B, H6C)] were positioned geometrically, whereas the corresponding minor parts, (H5D, H5E, H5F) and (H6D, H6E, H6F) were located in a difference fourier map. A rotating group model (AFIX 137) was used for both major and minor parts of disordered methyl groups and refined using a riding model with $U_{\mathrm{iso}}(\mathrm{H})=1.5 U_{\mathrm{eq}}(\mathrm{C})[\mathrm{C}-\mathrm{H}$ distance $=0.96 \AA$ ]. The refined siteoccupancy ratios are (H5A, H5B, H5C):(H5D, H5E, H5F) = 0.77 (4):0.23 (4) and (H6A, H6B, H6C):(H6D, H6E, H6F) = 0.84 (4):0.16 (4). The remaining $H$ atoms were positioned geometrically [ $\mathrm{C}-\mathrm{H}=0.96$ and $0.97 \AA$ ] and refined with $U_{\mathrm{iso}}(\mathrm{H})=1.2$ or $1.5 U_{\mathrm{eq}}(\mathrm{C})$. A rotating group model was also applied to the other methyl group in the final refinement.

## Computing details

Data collection: APEX2 (Bruker, 2009); cell refinement: SAINT (Bruker, 2009); data reduction: SAINT (Bruker, 2009); program(s) used to solve structure: SHELXTL (Sheldrick, 2008); program(s) used to refine structure: SHELXTL
(Sheldrick, 2008); molecular graphics: SHELXTL (Sheldrick, 2008); software used to prepare material for publication: SHELXTL (Sheldrick, 2008) and PLATON (Spek, 2009).

6429 measured reflections
1671 independent reflections
1504 reflections with $I>2 \sigma(I)$
$R_{\text {int }}=0.029$
$\theta_{\text {max }}=65.0^{\circ}, \theta_{\text {min }}=5.6^{\circ}$
$h=-6 \rightarrow 8$
$k=-11 \rightarrow 11$
$l=-15 \rightarrow 15$

Hydrogen site location: inferred from neighbouring sites
H atoms treated by a mixture of independent and constrained refinement
$w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.0573 P)^{2}+0.1221 P\right]$
where $P=\left(F_{\mathrm{o}}{ }^{2}+2 F_{\mathrm{c}}{ }^{2}\right) / 3$
$(\Delta / \sigma)_{\text {max }}=0.001$
$\Delta \rho_{\text {max }}=0.19 \mathrm{e}^{-3}$
$\Delta \rho_{\text {min }}=-0.17 \mathrm{e} \AA^{-3}$
Extinction correction: SHELXTL (Sheldrick, 2008), $\mathrm{Fc}^{*}=\mathrm{kFc}\left[1+0.001 \mathrm{xFc}^{2} \lambda^{3} / \sin (2 \theta)\right]^{-1 / 4}$ Extinction coefficient: 0.0041 (9)

## Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
Refinement. Refinement of $F^{2}$ against ALL reflections. The weighted $R$-factor $w R$ and goodness of fit $S$ are based on $F^{2}$, conventional $R$-factors $R$ are based on $F$, with $F$ set to zero for negative $F^{2}$. The threshold expression of $F^{2}>\sigma\left(F^{2}\right)$ is used only for calculating $R$-factors(gt) etc. and is not relevant to the choice of reflections for refinement. $R$-factors based on $F^{2}$ are statistically about twice as large as those based on $F$, and $R$ - factors based on ALL data will be even larger.

Hydrogen-bond geometry ( $A,{ }^{\circ}$ )
$C g 1$ is the centroid of $\mathrm{S} 1 / \mathrm{C} 1-\mathrm{C} 4$ ring.
