ABSTRACT

In this study, the complete mitochondrial genome of *Volutarpa perryi* has been determined for the first time. The mitogenome is of 15 255 bp in length, including 13 protein-coding genes, two ribosomal RNA genes and 22 transfer RNA genes. The overall base composition is 29.6%, 38.6%, 15.6% and 16.2% for A, T, C and G, respectively. The 13 PCGs of *V. perryi* and other 12 mollusk species were used for phylogenetic analysis by maximum-likelihood method, and the phylogenetic tree demonstrated the close relationship of *V. perryi* to species of Buccinoidea. The results are expected to provide useful molecular data for species identification and further phylogenetic studies of genus *Volutarpa*.

KEYWORDS

Buccinidae; mitochondrial genome; phylogeny; *Volutarpa perryi*

Volutarpa perryi, a kind of marine gastropod mollusks in genus *Volutarpa* of family Buccinidae, inhabiting shallow soft mud or mud sandy seabeds, is mainly distributed in Japan, Korea and Northern Yellow Sea of China (Zhang 2008). Many researches had described *V. perryi* as fishery resource (Ganmanee et al. 2004; Zhang et al. 2015), but few reports about this species at the molecular level were available (Hou et al. 2013). In this study, we determined the complete mitochondrial genome of *V. perryi* for the first time, expecting to

contribute to the better understanding of this species and provide information for the taxonomic and phylogenetic study of the genus *Volutarpa*.

The specimen of *V. perryi* were collected from Zhangzi Island of China in June 2015. Standard phenol-chloroform method (Sambrook & Russel 2002) was used to extract total genomic DNA from the muscle tissue. Based on the sequences of COX1, 12S rRNA and 16S rRNA (GenBank accession number HQ834060.1, HQ833869.1 and HQ833930.1,

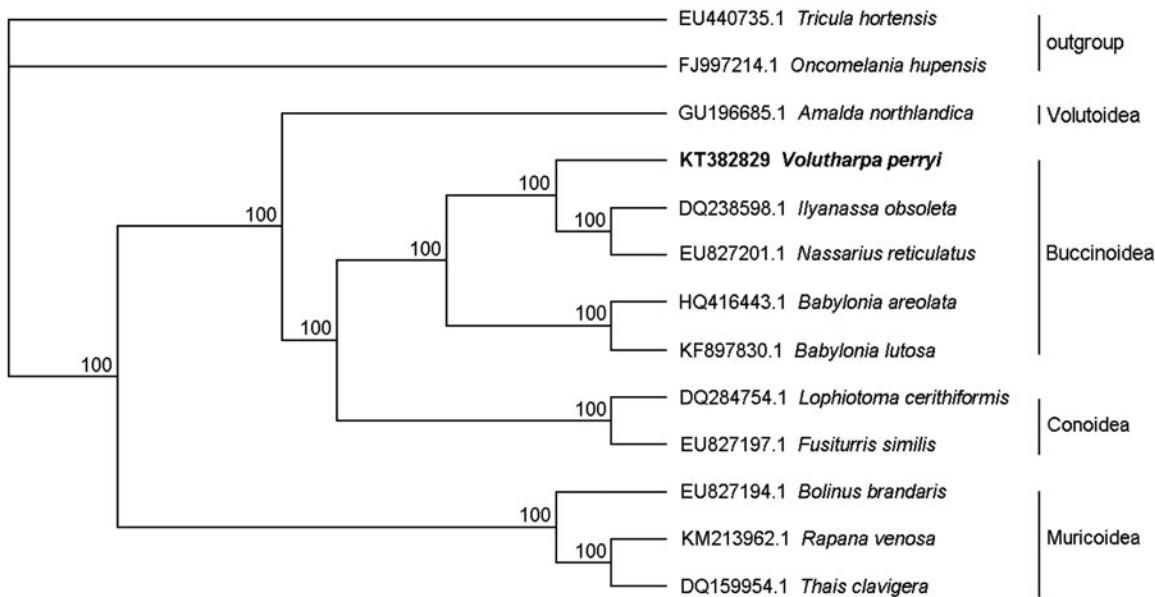

Figure 1. ML phylogenetic analysis for *Volutarpa perryi* based on the concatenated nucleotide sequences of 13 mitochondrial protein-coding genes. *Tricula hortensis* and *Oncomelania hupensis* are designated as outgroup. Numbers on nodes indicate the bootstrap value.

respectively), six pairs of primers were designed: three pairs were employed to confirm the known sequences and the other three pairs to obtain three gaps. Long and accurate polymerase chain reaction method was used to determine the three unknown fragments: ~3600 bp from COX1 to 12S rRNA, ~1000 bp from 12S to 16S rRNA and ~9500 bp from 16S rRNA to COX1. After sequenced and assembled, the complete mitogenome sequence was got and deposited into GenBank with the accession number **KT382829**.

The complete mitogenome of *V. perryi* is a closed circular molecule of 15 255 bp, consists of 13 protein-coding genes, two ribosomal RNA genes and 22 transfer RNA genes. The total base composition is 29.6% for A, 38.6% for T, 15.6% for C, 16.2% for G, with the AT content (68.2%) higher than that of GC. All genes are encoded on H-strand except seven tRNA genes. All of the 13 PCGs use ATG as the start codon, nine of them use TAA as the stop codon while ND4L, ND4, ND3 and ND2 end with TAG. The 12S rRNA (881bp) and 16S rRNA (1357 bp) is adjacent in position except the tRNA-Val located between them. The tRNA genes were identified by ARWEN online service (<http://130.235.46.10/ARWEN/>), all of them could be folded in the typical cloverleaf structure except tRNA-Ser.

To understand the phylogenetic relationships, the amino acid sequence of 13 PCGs of *V. perryi* and other 12 mollusks were concatenated for analysis. Tree constructed by Phylophil-3.695 using maximum-likelihood method was shown (Figure 1), and the formation of major clades was identical to the conclusion made from the morphological taxonomy. Some taxonomic studies had reported that *V. perryi* was allocated to genus *Buccinum* and named as *Buccinum perryi* (Zhang & Qi 1962; Zhao et al. 1982). However, no information about the complete mitogenome of *Buccinum* was found in GenBank, there is a lack of comparison of *Buccinum* with *V. perryi*. In the phylogenetic tree, *V. perryi* showed a closer

relationship with the family Nassariidae, so it is necessary to combine morphology, molecular biology and information of relative species for the taxonomy of *V. perryi* in further study.
