Received 8 September 2008; accepted 10 September 2008

Key indicators: single-crystal X-ray study; $T = 150\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; R factor = 0.111; wR factor = 0.274; data-to-parameter ratio = 17.4.

In the title compound, $\text{C}_{11}\text{H}_{14}\text{N}_2\text{O}_3$, the planar hydrazide group is oriented with respect to the benzene ring at a dihedral angle of $48.00(3)^\circ$. In the crystal structure, intermolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds link the molecules.

(E)-3-(3,5-Dimethoxyphenyl)acrylohydrazide

S. Ahmed, G. Qadeer, N. H. Rama and A. Ruzicka

Comment

Aromatic hydrazides are important intermediates in heterocyclic chemistry and have been used for the synthesis of various biologically active five-membered heterocycles such as 2,5-disubstituted-1,3,4-oxadiazoles (Zheng *et al.*, 2003; Al-Talib *et al.*, 1990) and 5-substituted-2-mercapto-1,3,4-oxadiazoles (Yousif *et al.*, 1986; Ahmad *et al.*, 2001; Al-Soud *et al.*, 2004; El-Emam *et al.*, 2004). In view of the versatility of these compounds, we have synthesized the title compound, and report herein its crystal structure.

In the molecule of the title compound, (Fig. 1), the bond lengths (Allen *et al.*, 1987) and angles are generally within normal ranges. The benzene ring (C4-C9) is oriented with respect to the planar hydrazide group (O1/N1/N2/C1) at a dihedral angle of 48.00 (3)°.

In the crystal structure, intermolecular N-H···O hydrogen bonds (Table 1) link the molecules (Fig. 2), in which they may be effective in the stabilization of the structure.

Experimental

The title compound was synthesized by the reaction of methyl ester of (E)-3 -(3,5-dimethoxyphenyl)acrylic acid with hydrazine hydrate according to the literature method (Furniss *et al.*, 1978). For the preparation of the title compound, a mixture of (E)-methyl 3-(3,5-dimethoxyphenyl)acrylate (2.22 g, 10 mmol) and hydrazine hydrate (15 ml, 80%) in absolute ethanol (50 ml) was refluxed for 5 h at 413–423 K. The excess solvent was removed by distillation. The solid residue was filtered off, washed with water and recrystallized from ethanol (30%) to give the title compound (yield; 1.55 g, 70%, m.p. 401–402 K). Colorless single crystals were obtained by slow evaporation of an ethanol solution at room temperature.

Refinement

H atoms were positioned geometrically, with N-H = 0.86 Å (for NH and NH₂) and C-H = 0.93 and 0.96 Å for aromatic and methyl H, respectively, and constrained to ride on their parent atoms with U_{iso}(H) = 1.2U_{eq}(C,N).

Figures

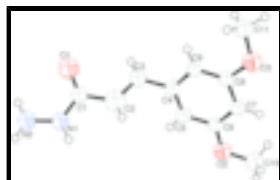

Fig. 1. The molecular structure of the title molecule with the atom-numbering scheme.

supplementary materials

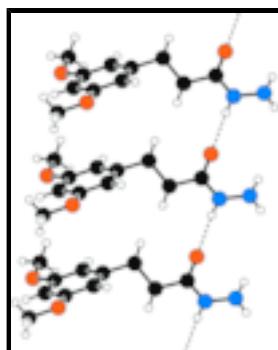

Fig. 2. A packing diagram of the title compound. Hydrogen bonds are shown as dashed lines.

Fig. 3. Reaction scheme.

	$0.90 \times 0.17 \times 0.12 \text{ mm}$

Data collection

Bruker–Nonius KappaCCD area-detector diffractometer	2522 independent reflections
Radiation source: fine-focus sealed tube	1547 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.139$
Detector resolution: 9.091 pixels mm^{-1}	$\theta_{\text{max}} = 27.5^\circ$
$T = 150(1) \text{ K}$	$\theta_{\text{min}} = 3.0^\circ$
ϕ and ω scans	$h = -5 \rightarrow 6$
Absorption correction: Gaussian (Coppens, 1970)	$k = -39 \rightarrow 35$
$T_{\text{min}} = 0.961$, $T_{\text{max}} = 0.993$	$l = -10 \rightarrow 9$
7864 measured reflections	

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites

$R[F^2 > 2\sigma(F^2)] = 0.111$	H-atom parameters constrained
$wR(F^2) = 0.274$	$w = 1/[\sigma^2(F_o^2) + (0.0574P)^2 + 2.6221P]$
$S = 1.13$	where $P = (F_o^2 + 2F_c^2)/3$
2522 reflections	$(\Delta/\sigma)_{\max} < 0.001$
145 parameters	$\Delta\rho_{\max} = 0.33 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\min} = -0.41 \text{ e } \text{\AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
