Sound analyses

Selection of audio files for expert identification

Experts listened to soundscapes and looked at the spectrogram, they were allowed to re-listen as many times as they wanted. They were blinded to the spatial location and habitat type of the audio file. Unknown amphibian species were treated as sound-morpho-species. All amphibian species were anonymized for conservation reasons.

Figure S1: Overview on the time windows selected for expert identification from all sampled audio files during two weeks.

Table S1: List of 77 bird species selected from CNN models with probability to occur in our study site Canande, based on a local species list. From these species four were further excluded either because of low probability of occurrence in the study area and/or because of no detection via CNN model. Shared species occurred in the data set of CNN identification and in the data identified by expert 1.

Bird Species	Unprobable	Not recorded in CNN with prob >0.8	Shared 49 species
<i>Aburria aburri</i>			x
<i>Amazona autumnalis</i>			
<i>Ara ambigua</i>			
<i>Campephilus gayaquilensis</i>			x
<i>Camptostoma obsoletum</i>			x
<i>Campylorhamphus trochilirostris</i>		x	
<i>Cantorchilus leucopogon</i>			x
<i>Celeus loricatus</i>			x
<i>Claravis pretiosa</i>			x
<i>Clibanornis rubiginosus</i>			x
<i>Colaptes rubiginosus</i>			
<i>Conopias albobittatus</i>			x
<i>Contopus sordidulus</i>			x
<i>Cryptoleucopteryx plumbea</i>			
<i>Crypturellus soui</i>			x
<i>Cyanoloxia cyanoides</i>			
<i>Cyclarhis nigrirorstris</i>	x		
<i>Dendrocincla fuliginosa</i>			x
<i>Dendrocolaptes sanctithomae</i>			x
<i>Dendrocygna autumnalis</i>	x	x	
<i>Dryobates callonotus</i>			
<i>Dysithamnus puncticeps</i>			x
<i>Elaenia flavogaster</i>			x
<i>Electron platyrhynchum</i>			x
<i>Formicarius nigricapillus</i>			x
<i>Furnarius leucopus</i>			x
<i>Glaucidium peruanum</i>			
<i>Grallaria guatemalensis</i>			x
<i>Gymnopathys bicolor</i>			
<i>Hafferia zeledoni</i>			x
<i>Hylopezus perspicillatus</i>			x
<i>Legatus leucophaeus</i>			x
<i>Lepidocolaptes souleyetii</i>			x
<i>Leptotila verreauxi</i>			x
<i>Lipaugus unirufus</i>			x
<i>Lophotrix cristata</i>			
<i>Lophotriccus pileatus</i>			x
<i>Micrastur semitorquatus</i>			

<i>Microbates cinereiventris</i>		X
<i>Microcerculus marginatus</i>		X
<i>Momotus subrufescens</i>		
<i>Notharchus hyperrhynchus</i>		
<i>Nyctidromus albicollis</i>		
<i>Nyctiphrynus rosenbergi</i>		X
<i>Nystalus radiatus</i>		X
<i>Ornithion brunneicapillus</i>		X
<i>Ortalis erythroptera</i>		
<i>Patagioenas subvinacea</i>		X
<i>Penelope purpurascens</i>		X
<i>Phaenostictus mcleannani</i>		X
<i>Pharomachrus auriceps</i>		
<i>Philydor rufum</i>		
<i>Piaya cayana</i>		X
<i>Poliocrania exsul</i>		
<i>Pseudastur occidentalis</i>		
<i>Querula purpurata</i>		X
<i>Ramphastos ambiguus</i>		X
<i>Ramphastos brevis</i>		X
<i>Ramphocaenus melanurus</i>		X
<i>Saltator atripennis</i>		
<i>Saltator grossus</i>		X
<i>Saltator maximus</i>	X	
<i>Schiffornis veraepacis</i>		X
<i>Sipia nigricauda</i>		
<i>Sittasomus griseicapillus</i>		
<i>Spizaetus ornatus</i>		
<i>Sporophila funerea</i>		X
<i>Taraba major</i>		X
<i>Thamnistes anabatinus</i>		
<i>Tinamus major</i>		X
<i>Trogon collaris</i>		X
<i>Trogon comptus</i>		X
<i>Trogon mesurus</i>		
<i>Trogon rufus</i>		X
<i>Turdus maculirostris</i>		X
<i>Xiphorhynchus erythropygius</i>		X
<i>Zimmerius albigularis</i>		X

Species richness across habitat types

Figure S2: Richness values across recovery stages. (a) Total species richness of vocalizing vertebrates and (b) richness of vocalizing vertebrate species observed in our old-growth plots. For agricultural legacies (P = pasture, C = cacao) duration of recovery ranges from 1-19 years (Reg I) and 20-34 years (Reg II). Each of the seven categories is displayed in different colours.

Comparison of two bird experts

Figure S3: Comparison of NMDS community axis 1 based on two data sets with identification of bird species by two different bird experts.

Figure S4: Spline correlogram plots to test for spatial independence of model residuals of the 4 models using acoustic indices (upper two rows) and CCN-based community axis 1 (lower row) as predictor. In all plots the 95% pointwise grey confidence band includes the zero line, underlining spatial independence of residuals in our models.
