Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.010\text{ \AA}$; R factor = 0.054; wR factor = 0.129; data-to-parameter ratio = 19.2.

In the title compound, $\text{C}_{13}\text{H}_9\text{ClINO}_4\text{S}$, the dihedral angle between the aromatic rings is $81.04(17)^\circ$. The disposition of the I and Cl atoms attached to the two rings is *anti*. In the crystal, molecules are connected via $\text{O}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds.

Comment

The title compound, (I), is an example of a halogenated sulfonamide, which are reported as inhibitors for the growth of multidrug resistant MCF-7/ADR cancer cells (Medina *et al.*, 1999). In continuation to our researches with sulfonamides (Arshad *et al.*, 2009a), the title compound has been prepared, as an intermediate for the preparation of thiazine related heterocycles (Arshad *et al.*, 2008, 2011).

The crystal structure of (I) being reported here as an isomer of previously reported compound 2-chloro-5-(2-iodobenzenesulfonamido)benzoic acid (II), (Arshad, *et al.*, 2009a). The bond lengths and bond angles are also comparable with the 5-benzenesulfonamido-2-chlorobenzoic acid (III), (Arshad, *et al.*, 2009b) and 4-(2-Iodobenzenesulfonamido)benzoic acid monohydrate (IV) (Arshad, *et al.*, 2009c). The two aromatic rings A (C1-C6) and B (C7-C12) are oriented at dihedral angle of 81.04 (17) $^{\circ}$ which is lower than in (IV i.e. 87.07 (6) $^{\circ}$) and greater than in (II i.e. 74.46 (9) $^{\circ}$) and (III i.e. 74.18 (17) $^{\circ}$). No intramolecular hydrogen bonding interaction have been observed in the molecule. The intermolecular interaction of O—H \cdots O and N—H \cdots O forms three dimensional network to stabilize structure of molecule (Fig. 2 and Tab. 1).

Experimental

The title compound was prepared following the method of Arshad *et al.* (2009a). Red needles were recrystallised from methanol.

Refinement

All the H-atoms were positioned with idealized geometry with C—H = 0.93 Å, N—H = 0.86 Å, O—H = 0.82 Å and were refined using a riding model with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}$ for aromatic C and N atoms and with $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}$ for O atom.

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
