#### Comment

Compounds containing azomethine groups ( $\text{C}=\text{N}$ ) play a vital role in chemistry (Khuhawar *et al.*, 2004). Schiff-base compounds have been used as fine chemicals and medical substrates such as intermediates for the various reactions and antibacterial (Asiri & Khan, 2010), antitumor activity (Saxena & Tandon, 1983) and anti-HIV activity (Pandeya *et al.*, 1999). Schiff bases containing heterocyclic rings dramatically increase the biological activity. The crystal structure of title compound (I), (Fig. 1) is being reported here.

Recently, we have reported the crystal structure of (II) *i.e.*, 4-[(anthracen-9-ylmethylidene)amino]-1,5-dimethyl-2-phenyl-1*H*-pyrazol-3(2*H*)-one (Asiri *et al.*, 2011a) and (III) *i.e.*, *N*-[*(E*)-1,3-benzodioxol-5-ylmethylidene]-3,4-dimethyl-1,2-oxazol-5-amine (Asiri *et al.*, 2011b) which contain the common moieties of (I).

In (I), the anthracen rings A (C1–C6), B (C1/C6/C7/C8/C13/C14) and C (C8–C13) are planar with r. m. s. deviations of 0.0090, 0.0241 and 0.0063 Å, respectively. The dihedral angles A/B, A/C and B/C are 4.80 (11)°, 8.36 (11)° and 3.90 (10)°, respectively. The 3,4-dimethyl-1,2-oxazol-5-amine moiety D (N1/C16–C20/N2/O1) is also planar with r. m. s. deviation of 0.0061 Å. The dihedral angles A/D, B/D and C/D are 7.59 (10)°, 3.85 (10)° and 5.48 (10)°, respectively. Intra-molecular H-bonds of C—H···N and C—H···O type complete S(6) and S(5) ring motifs (Fig. 1) (Bernstein *et al.*, 1995). The crystal packing shows the anthracen ring planes stacked in parallel sheets along [100].

#### Experimental

A mixture of anthracene-9-carbaldehyde (0.50 g, 2.4 mmol) and 5-amino-3,4-dimethylisoxazole (2.4 mmol) in ethanol (15 ml) was heated for 3 h. The progress of the reaction was monitored by TLC. The solid that separated from the cooled mixture was collected and recrystallized from a methanol:chloroform mixture (8:2) to give red prisms of (I).

Red solid: Yield: 82%, m.p. 419–420 K.

#### Refinement

Aromatic H-atoms were positioned geometrically ( $\text{C}-\text{H} = 0.93\text{\AA}$ ) and refined as riding with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ ; methyl H positions were derived from difference maps (HFIX 137) and refined with  $\text{C}-\text{H} = 0.96\text{\AA}$  and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$

### Special details

**Geometry.** Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
