Maintenance therapy with a poly (ADP-ribose) polymerase inhibitor in patients with newly diagnosed advanced epithelial ovarian cancer: updated individual patient data and trial-level meta-analysis

We have recently published an extracted individual patient data (IPD) meta-analysis on the efficacy of maintenance therapy with poly (ADP-ribose) polymerase (PARP) inhibitor (PARPi) in patients with newly diagnosed epithelial ovarian cancer in ESMO Open.¹ We now report an updated IPD meta-analysis after inclusion of extracted data (Supplementary Table S1, available at https://doi.org/10.1016/j.esmoop. 2022.100632 and Supplementary Figures S1-S5, available at

https://doi.org/10.1016/j.esmoop.2022.100632) from the recently published ATHENA-MONO trial, which was published after our report.²

In the combined patient population from ATHENA-MONO and three other randomized trials,³⁻⁵ excluding the SOLO-1 trial,⁶ which only included patients with germline *BRCA1* or *BRCA2* mutations, there were 2834 patients with 1596 events. The progression-free survival (PFS) was significantly longer in the PARPi group [median 20.3 months; 95% confidence interval (CI) 18.6-21.9 months] versus the placebo group (median 14.4 months; 95% CI 13.2-15.7 months) with a hazard ratio (HR) of 0.66 (95% CI 0.60-0.73; *P* <0.001), as shown in Supplementary Figure S6, available at https://doi.org/10.1016/j.esmoop.2022.100632. In subgroup analyses, after including the ATHENA-MONO data, the benefit of PARPi versus placebo continued to be substantial in the somatic or germline *BRCA*-mutated subgroup

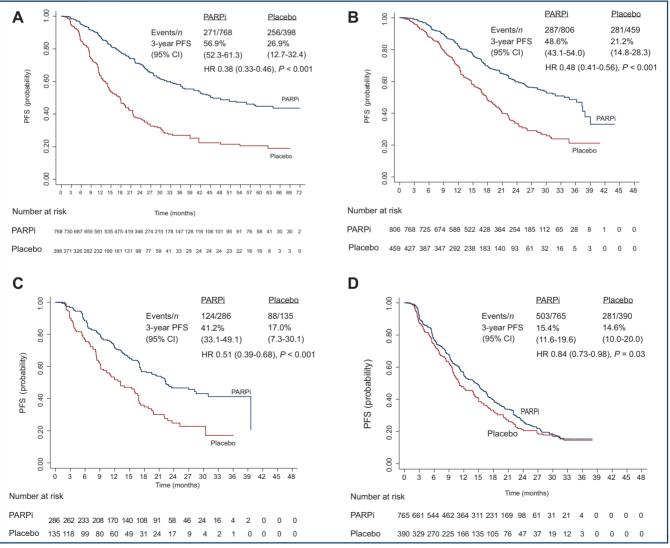

Figure 1. Progression-free survival (PFS) curves comparing poly (ADP-ribose) polymerase (PARP) inhibitor (PARPi) versus placebo in the BRCA/HRD subgroups with combined extracted individual patient data from five randomized controlled trials (RCTs).

(A) Germline and/or tumor BRCA-mutated, (B) HRD-positive including BRCA-mutated, (C) HRD-positive excluding BRCA-mutated, (D) HRD-negative, and (E) forest plots of individual patient data from five RCTs. HR, hazard ratio; HRD, homologous recombination deficiency.

Figure 1. Continued.

(including the data from the SOLO-1 trial), with a median PFS of 45.7 months (95% CI 40.0-63.8 months) versus 17.7 months (95% CI 14.4-19.3 months), respectively (HR 0.38, 95% CI 0.32-0.46; P < 0.001); the homologous recombination deficiency (HRD)-positive (including BRCA mutated) subgroup, with a median PFS of 34.6 months (95% CI 29.4-37.9 months) versus 17.6 months (95% Cl 16.6-19.3 months), respectively (HR 0.48, 95% CI 0.41-0.56; P <0.001); and the HRD-positive (excluding BRCA mutated) subgroup, with a median PFS of 22.3 months (95% CI 18.4-30.9 months) versus 13.1 months (95% CI 9.1-16.8 months), respectively (HR 0.51, 95% CI 0.39-0.68; P < 0.001). However, even after combining the ATHENA-MONO data, there is a lack of substantial benefit of PARPi versus placebo in patients with HRD-negative tumors with a median PFS of 14.5 months (95% CI 12.4-15.7 months) versus 11.0 months (95% CI 10.0-13.8 months), respectively (HR 0.84, 95% CI

0.73-0.98; P = 0.03). The PFS in various subgroups after including the ATHENA-MONO data are shown in Figure 1.

The ATHENA-MONO trial has several features that make its results, including in the HRD-negative subgroup, less definitive. These include a different assay [a percentage loss of heterozygosity (LOH) score] for measuring HRD and the highly imbalanced (4 : 1) randomization, which reduced the number of patients in the placebo arm. Notably, in the HRDnegative (BRCA wild type/LOH low) subgroup there were only 189 patients on rucaparib and 49 patients on placebo, which makes the reported PFS benefit of rucaparib (median 12.1 versus 9.1 months, HR 0.65, 95% CI 0.45-0.95) in this subgroup less precise. Our IPD meta-analysis also suggests that there is only a 3.5-month absolute PFS benefit of PARPi in the BRCA wild-type/HRD-negative subgroup, which is a relatively small gain in the context of newly diagnosed ovarian cancer. In summary, our updated IPD meta-analysis suggests that there is substantial PFS benefit of maintenance therapy with PARPi in patients with BRCA-mutated or HRD-positive tumors but not in those with HRD-negative tumors.
