Received 21 October 2010; accepted 22 November 2010

Key indicators: single-crystal X-ray study; $T = 193\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; disorder in main residue; R factor = 0.052; wR factor = 0.144; data-to-parameter ratio = 9.7.

The title compound, $\text{C}_{11}\text{H}_{22}\text{N}_2\text{O}_2$, has one chiral center and packs in the monoclinic space group $P2_1$. The asymmetric unit has five crystallographically independent molecules, four of which engage in intermolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonding.

(5*S*)-4-(2,2-Dimethylpropyl)-5-isopropyl-1,3,4-oxadiazinan-2-one

K. L. Edler, S. E. E. Kirk, R. A. Davis, S. R. Hitchcock and G. M. Ferrence

Comment

The fundamental structure of 1,3,4-oxadiazinan-2-one compounds has been known for nearly forty years (Trepanier *et al.*, 1968). We are interested in studying the underlying factors for differing conformations of this heterocycle and for its use as a chiral auxiliary in aldol addition reactions (Casper *et al.*, 2002; Burgeson *et al.*, 2004).

The oxadiazinanone ring is well suited to accommodate H-bonded dimers of the $R^2_2(8)$ type (Bernstein *et al.*, 1995; Etter *et al.*, 1990). The H-bond occurs most naturally between the carbonyl oxygen on the first molecule and the nitrogen containing the hydrogen atom on the second molecule, and *vice versa*. The result is an eight-membered ring in which two of the connections are H-bonds. These H-bonded dimers have a strong propensity to form in the oxadiazinanone system (Anderson *et al.*, 2006). A few examples of this type of H-bonding are seen in structures by Addison *et al.* (2008), Rodrigues *et al.* (2006), and Szczepura *et al.* (2004) (with REFCODES LOBVII, GEGZUO, and YAGJEW, respectively).

The title compound packs into a monoclinic, $P2_1$, space group. This compound is unusual in that there are five molecules in the asymmetric unit (see Figure 1). The best of these is illustrated in Figure 2. Of these five molecules, two pairs are engaged in $R^2_2(8)$ type H-bonding. The fifth molecule does not engage in H-bonding because the donor atom is surrounded by neopentyl substituents, effectively blocking any H-bonds to an acceptor atom. Figure 3 shows all five molecules in a wireframe style, with key atoms shown in a space-fill style, to highlight how the N—H is hemmed in by neopentyl substituents. Another, interactive, view in Figure 4 shows how inaccessible the donor N really is.

The number of crystallographically independent molecules in the asymmetric unit also warrants notice. Most of the structures in the Cambridge Structural Database have a Z less than or equal to 1. According to the August 2010 edition of the CSD (Allen, 2002), 91.1% of the structures have a Z less than or equal to 1. As Z increases, the percentage of structures decreases ($Z=2$, 7.7%; $Z=3$, 0.42%; $Z=4$, 0.40%). Only 0.014% ($N=73$) of structures in the CSD have a $Z=5$, which is a property of this structure.

Since the conformation of the heterocycle is of some interest, structure overlays were conducted in Mercury (Macrae *et al.*, 2008). Surprisingly, all five heterocycles exhibit the same conformation (seen in Figure 5); there is some swing observed in the isopropyl and neopentyl groups, but that deviation does not require the heterocycle to assume a different position in the crystal array. A Cremer-Pople ring analysis (Cremer & Pople, 1975; Boeyens, 1978), performed in PLATON (Spek, 2009), shows that all five molecules exhibit the 5E ring conformation, which is an envelope conformation with C5 as the flap apex. The data for the five oxadiazinanone rings are as follows: Ring 1 (O1—C6) - $Q=0.511$ (4); $\theta=56.7$ (5) $^\circ$; $\Phi=251.2$ (5) $^\circ$, Ring 2 (O21—C26) - $Q=0.499$ (4); $\theta=53.7$ (5) $^\circ$; $\Phi=253.9$ (5) $^\circ$, Ring 3 (O41—C46) - $Q=0.510$ (4); $\theta=56.7$ (4) $^\circ$; $\Phi=246.5$ (5) $^\circ$, Ring 4 (O61—C66) - $Q=0.492$ (5); $\theta=55.6$ (5) $^\circ$; $\Phi=239.9$ (6) $^\circ$, Ring 5 (O81—C86) - $Q=0.500$ (4); $\theta=55.9$ (5) $^\circ$; $\Phi=236.4$ (5) $^\circ$.

Upon conducting a *Mogul* geometry check (Bruno *et al.*, 2004), the N4—C10 (1.490 (5) Å) and N24—C30 bonds (1.488 (5) Å) were flagged as being outside the typical range for a C—N bond (mean 1.46 ± 0.01 Å). This bond is the one between the N atom of the heterocycle and the neopentyl substituent. This bond in the other three crystallographically

supplementary materials

independent molecules is not flagged. The bonds C50—C51 (1.508 (7) Å) and C90—C91 (1.507 (6) Å) were also flagged as unusual compared to the mean of 1.54 ± 0.01 Å. One last bond, N84—C85, was considered unusual with a value of 1.463 (5) Å *versus* a mean of 1.49 ± 0.01 Å. There is no obvious particular chemical or crystallographic explanation for these deviations. However, they still appear to be within an acceptable range. All angles were reported to be within normal limits.

Experimental

The title compound was prepared as previously reported (Casper *et al.* 2004). Single crystals were grown by vapor diffusion of hexane into an ethyl acetate solution of the title compound.

Refinement

All non-H atoms were refined anisotropically. All H atoms were initially identified through difference Fourier syntheses then removed and included in the refinement in the riding-model approximation (C—H = 0.98, 0.99 and 1.00 Å for CH₃, CH₂, and CH; $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ except for methyl groups, where $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$).

Figures

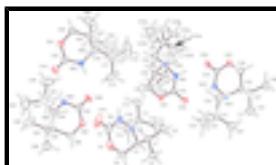

Fig. 1. *ORTEP* view of the title compound showing the atomic numbering scheme of all five independent molecules in the asymmetric unit. Ellipsoids are shown at 50% probability displacement and hydrogen atoms are omitted for clarity.

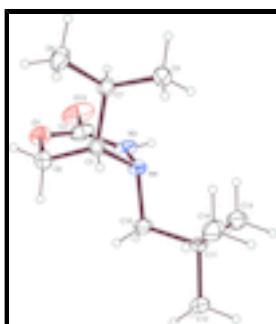

Fig. 2. *ORTEP* view of the title compound showing the atomic numbering scheme for the best of the five independent molecules. Ellipsoids are shown at 50% probability displacement and hydrogen atoms are omitted for clarity.

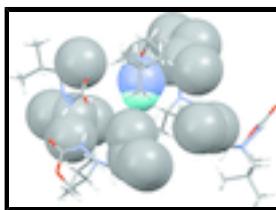

Fig. 3. A view of the asymmetric unit in Mercury. The molecule that is not engaged in H-bonding has the N and H atoms shown in spacefill mode. Aliphatic substituents (C atoms shown in spacefill) surround this N—H and prohibit it from H-bonding with a carbonyl group.

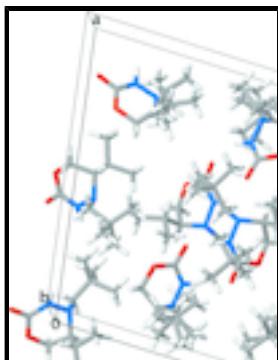

Fig. 4. The Jmol enhanced figure of the title compound. The H-bonding situation can clearly be seen by manipulating the various radiobuttons.

Fig. 5. An overlay of the five molecules in the asymmetric unit shown in Mercury. There is no significant variation of the oxadiazinone ring.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
