In the title compound, $C_{20}H_{16}Cl_2N_2O_2$, the indazole ring system is approximately planar [maximum deviation = 0.033 (1) Å], its mean plane is oriented at dihedral angles of 25.04 (4) and 5.10 (4)° to the furan and benzene rings, respectively. In the crystal, pairs of $C-H_{ind}\cdots O_{bo}$ (ind = indazole and bo = benzyloxy) hydrogen bonds link the molecules into centrosymmetric dimers with graph-set motif $R_2^2(12)$. Weak $C-H\cdots\pi$ interactions is also observed. Aromatic π – π stacking between the benzene and the pyrazole rings from neighbouring molecules [centroid–centroid distance = 3.8894 (7) Å] further consolidates the crystal packing.

1. Chemical context

Ethers such as miconazole and econazole possessing an imidazole ring have been developed for clinical uses as azole antifungals (Godefroi *et al.*, 1969). The crystal structures of miconazole (Peeters *et al.*, 1979) and econazole (Freer *et al.*, 1986) have previously been reported. Another azole ring system, indazole, is an important structural unit of many biologically active compounds. Some indazole derivatives have been shown to exhibit antifungal (Lebouvier *et al.*, 2007; Park *et al.*, 2007), antibacterial (Wang *et al.*, 2015), anti-proliferative (Büchel *et al.*, 2012), antitumor (Abbassi *et al.*, 2014) activity and act as inhibitors of nitric oxide synthase with antioxidant properties (Salerno *et al.*, 2012). The crystal structures of some indazole derivatives have been reported (Gerpe *et al.*, 2007; Raffa *et al.*, 2009; Boulhaoua *et al.*, 2015). In addition, the crystal structures of ketones containing an indazole group (Özel Güven *et al.*, 2013, 2014a) and ether (Özel Güven *et al.*, 2014b) have been described. As a continuation of our studies in this area, we synthesized the title compound and report herein its crystal structure.

OPEN ACCESS

2. Structural commentary

In the molecule of the title compound, (Fig. 1), the bond lengths and angles are within normal ranges. The indazole (*B*; N1/N2/C7–C13) ring system is approximately planar with a maximum deviation of $-0.033(1)$ Å for atom C10. Its mean plane is oriented with respect to the furan (*A*; O2/C2–C5) and benzene (*C*; C15–C20) rings at dihedral angles of $A/B = 25.04(4)$ and $B/C = 5.10(4)$ °. The dihedral angle between the furan and benzene rings is $20.21(5)$ °. Atom C6 is $-0.054(1)$ Å from the indazole ring plane, while atom C1 is $0.038(1)$ Å from the furan ring plane. Atoms C11, C12 and C14 are displaced by $-0.0430(3)$, $0.0233(4)$ and $-0.016(1)$ Å, respectively, to the benzene ring plane.

3. Supramolecular features

In the crystal, pairs of $C-H_{ind}\cdots O_{bo}$ ($ind =$ indazole and $bo =$ benzyloxy) hydrogen bonds (Table 1), enclosing $R_2^2(12)$ ring motifs link the molecules into centrosymmetric dimers (Fig. 2), which are stacked along the *a* axis and oriented along the *b*-axis direction (Fig. 3). Weak $C-H\cdots\pi$ interactions (Table 1) occur. $\pi\cdots\pi$ interactions between the pyrazole and the benzene rings, $Cg4\cdots Cg3^i$, of neighbouring molecules further consolidate the crystal packing [centroid–centroid distance = $3.8894(7)$ Å; symmetry code: (i) $2 - x, 2 - y, -z$; $Cg3$ and $Cg4$ are the centroids of rings *C* (C15–C20) and *D* (N1/N2/C7–C13)].

4. Synthesis and crystallization

The title compound was synthesized by the reaction of 1-(furan-2-yl)-2-(2*H*-indazol-2-yl)ethanol with NaH and 2,5-dichlorobenzyl bromide. NaH (16 mg, 0.394 mmol) was added in small fractions to a solution of alcohol (90 mg, 0.394 mmol) in DMF (3–4 ml). Then, 2,5-dichlorobenzyl bromide (95 mg, 0.394 mmol) was added portionwise. The mixture was stirred at room temperature for 3 h, and the excess hydride was decomposed with a small amount of methyl alcohol. After evaporation to dryness under reduced pressure, a small amount of water was added and extracted with methylene

chloride. The organic layer was separated, dried over anhydrous sodium sulfate, and then evaporated to dryness. The crude residue was purified by chromatography on a silica-gel column using a hexane–ethyl acetate mixture (10:1) as eluent. The ether was recrystallized from 2-propanol solution to obtain colourless crystals suitable for X-ray analysis (yield: 70 mg, 46%).

5. Refinement

The experimental details including the crystal data, data collection and refinement are summarized in Table 2. The C-bound H atoms were positioned geometrically with $C-H = 0.93, 0.97$ and 0.98 Å, for aromatic, methylene and methine H-atoms, respectively, and constrained to ride on their parent atoms, with $U_{iso}(H) = 1.2U_{eq}(C)$.

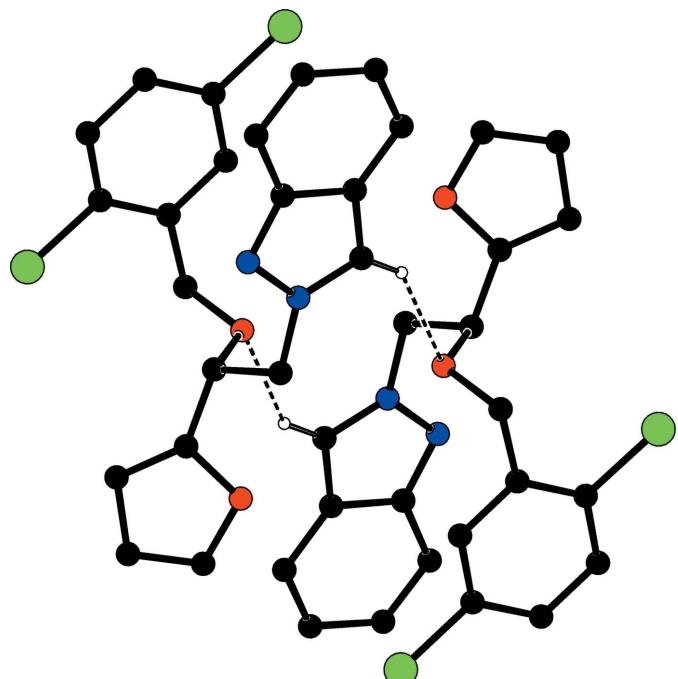

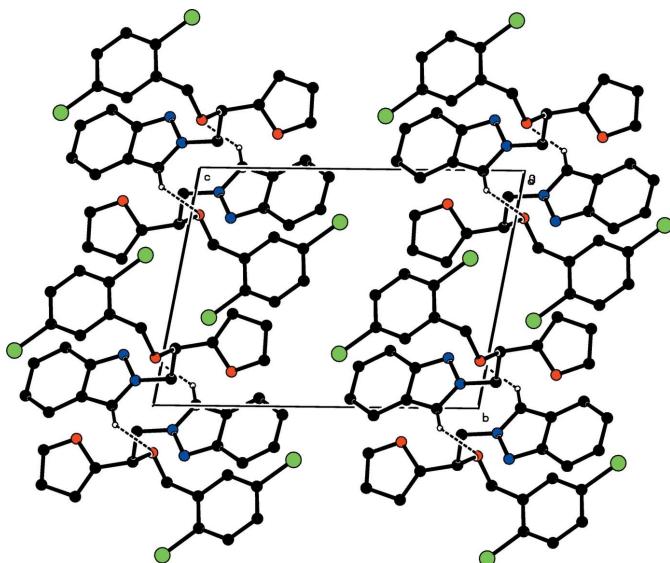

Figure 2

Part of the crystal structure. Intermolecular $[C-H_{ind}\cdots O_{bo}]$ hydrogen bonds, enclosing $R_2^2(12)$ ring motifs, are shown as dashed lines (see Table 1). H atoms not involved in hydrogen bonding have been omitted for clarity.

**Figure 3**

The crystal packing of the title compound, viewed down the a axis. Hydrogen bonds are shown as dashed lines. H atoms not involved in hydrogen bonding have been omitted for clarity.

Refinement

Refinement on F^2	0 restraints
Least-squares matrix: full	Primary atom site location: structure-invariant
$R[F^2 > 2\sigma(F^2)] = 0.031$	direct methods
$wR(F^2) = 0.083$	Secondary atom site location: difference Fourier
$S = 1.05$	map
4278 reflections	Hydrogen site location: inferred from
235 parameters	neighbouring sites

H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + (0.0387P)^2 + 0.3381P]$
 where $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.001$
 $\Delta\rho_{\max} = 0.35 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.23 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.

Hydrogen-bond geometry (Å, °)

Cg4 is the centroid of the N1/N2/C7/C8/C13 ring.

D—H···A	D—H	H···A	D···A	D—H···A
C7—H7···O1 ⁱ	0.93	2.51	3.3062 (15)	144
C6—H6B···Cg4 ⁱⁱ	0.97	2.84	3.4583 (13)	122

Symmetry codes: (i) $-x+1, -y, -z+2$; (ii) $-x+2, -y+2, -z$.
