ABSTRACT: Benzofused seven-membered heterocycles such as $1,4-$ benzo[e]diazepines ( 1,4 -BZDs) and 1,4 -benzo $[e]$ oxazepines ( 1,4 -BZOs) were efficiently synthesized by Rh-catalyzed hydrofunctionalization of internal alkynes and allenes in good to excellent yields. The asymmetric hydroamination of (aminomethyl)anilines gave rise to 3 -vinyl-1,4-BZDs with excellent enantioselectivities. Orthogonal $N$-deprotection of 1,4BZDs allowed an easy entry to an advanced pyrrolobenzodiazepine
 metabolite of the $V_{2}$-receptor antagonist Lixivaptan.

Benzofused seven-membered rings containing two heteroatoms ( $\mathrm{N}, \mathrm{O}$ ) comprise the structural core of a privileged family of drugs employed to treat several indications. ${ }^{1}$ 1,4-Benzo[e]diazepines (1,4-BZDs) are known to interact with a variety of human receptors ${ }^{2}$ and have been extensively used to treat Central Nervous System (CNS) illnesses, ${ }^{3}$ cancer, ${ }^{4}$ or HIV virus. ${ }^{5}$ In addition, several drugs and advanced metabolites possess a stereodefined chiral Csp ${ }^{3}$ in C3 ( 1,4 benzodiazepine numbering), which enhances their biological activity, ${ }^{6}$ e.g., the pyrrolobenzodiazepines (PBZDs), ${ }^{7}$ bearing a $[7,5]$ ring fusion with an $N$-bridgehead (Figure 1). On the other hand, 1,4-benzo[e]oxazepines (1,4-BZOs) possess recognized pharmacological activity in the treatment of Alzheimer disease ${ }^{8}$ and as tranquilizers. ${ }^{9}$

These highly relevant biological activities of 1,4-BZDs have inspired chemists over the years to develop a variety of synthetic approaches based on Friedel-Crafts reactions, ${ }^{10}$ ring expansions, ${ }^{11}$ aza-Michael cyclizations, ${ }^{12}$ click chemistry, ${ }^{13}$ heteroannulations, ${ }^{14}$ Ugi condensations, ${ }^{15}$ or 1,5 -hydride

transfer cyclization reactions. ${ }^{16}$ Although all of these strategies could be considered very useful to build the azaheterocycle skeleton, they lack the capacity to introduce stereodefined $\mathrm{Csp}^{3}$ formation in C-3, e.g., a chiral allylic/homoallylic amine (Figure 1)

In this regard, transition metal-catalyzed asymmetric hydrofunctionalization/cyclization of allenes/internal alkynes has been used as an eco-friendly strategy to afford enantioenriched five- and six-membered heterocycles from achiral starting materials. ${ }^{17}$ The combination with a catalytic amount of Brønsted acids allows the $\pi$-allyl intermediate formation that can be subsequently trapped with $N$ - and $O$-nucleophiles to afford the corresponding chiral allylic amine or allyl ether (Scheme 1). ${ }^{17}$ This methodology was pioneered by Yamamoto (Scheme 1a), ${ }^{18}$ who was able to obtain a racemic fivemembered ring in a Pd-catalyzed hydroamidation of allenes, ${ }^{18 \mathrm{a}}$ and later the enantioenriched five- and six-membered rings in a Pd-catalyzed hydroamidation of internal alkynes. ${ }^{18 \mathrm{~b}}$ The groups of Toste, Liu, and Widenhoefer were working successfully on catalytic Au and Bronsted acid heterocyclizations of allenes (Scheme 1b). ${ }^{19}$ Recently, the group of Breit ${ }^{20}$ has developed an intensive study of the Rh-catalyzed hydrofunctionalizations to afford enantioenriched $\alpha$-vinylated five- and six-membered azaheterocycles (through NTs nucleophiles) ${ }^{20 e, f}$ and tetrahydropyrans (Scheme 1c). ${ }^{20 g}$ However, only a single benzofused seven-membered azaheterocycle, 4-vinyl-tetrahydrobenzo[b][1,5]-benzoxazepine, could

be synthesized in low chemical yield but good ee using the same protocol. ${ }^{21}$ Herein, we report a Rh-catalyzed hydrofunctionalization of internal alkynes and allenes to benzofused seven-membered heterocycles employing substrates bearing $\mathrm{N}-\mathrm{Ar}$ groups as nitrogenated nucleophiles. ${ }^{21 \mathrm{~g}}$ The enantioselective hydroamination to 3 -vinyl-1,4-BZDs and hydroalkoxylation to 3 -vinyl-1,4-BZO is conveniently disclosed (Scheme 1).

We began our study exploring the virtually unknown intramolecular Rh-catalyzed hydrofunctionalizations of internal alkynes to seven-membered heterocycles (Scheme 2). Gratify-

ingly, benzylic alcohol 1a $(X=O, Z=N T s)$ smoothly cyclized, under standard conditions, ${ }^{20 a}$ to the corresponding 3 -vinyl-1,4benzoxazepine 2 a in very good yield. On changing the nature of the heteroatoms, using oxygen as alkyne tether and PMPprotected amine as a nucleophile, ${ }^{22} \mathbf{1 b}(\mathrm{X}=\mathrm{NPMP}, \mathrm{Z}=\mathrm{O})$, the heterocyclization efficiency to $\mathbf{2 b}$ dropped to $41 \%$ yield. In this case, partial depropargylation of starting material was detected, whereas when the carbon-tethered alkynylamine 1c ( $\mathrm{X}=\mathrm{NPMP}, \mathrm{Z}=\mathrm{CH}_{2}$ ) was used, the corresponding $\alpha$-vinyl-2benzazepine 2c was isolated in a moderate $57 \%$ yield. ${ }^{23}$ To our delight, when both the nucleophile and the alkyne tether were nitrogen atoms, 1d ( $\mathrm{X}=\mathrm{NPMP}, \mathrm{Z}=\mathrm{NBoc}$ ), the hydroamination smoothly occurred to give the desired 3-vinyl-1,4BDZ 2d in fairly good yield.

To accomplish our synthetic goal, we then proceeded to evaluate the Rh-catalyzed asymmetric hydroamination of $\mathbf{1 d}$ (Table 1), with a slight modification of our previous conditions regarding reactants loadings and temperature.

Table 1. Optimization of Rh-Catalyzed Asymmetric Hydroamination of Internal Alkynes 1d and 1e

${ }^{a}$ Reaction conditions: $4 \mathrm{~mol} \%[\mathrm{Rh}(\operatorname{cod}) \mathrm{Cl}]_{2}, 10 \mathrm{~mol} \% \mathrm{~L}^{*}, 10 \mathrm{~mol} \%$ Brønsted acid, DCE ( 0.4 M ). ${ }^{b} 5$ days. ${ }^{c}$ The (S)-2d was observed as a major enantiomer. ${ }^{d}$ Reaction performed at $70{ }^{\circ} \mathrm{C} . \mathrm{PMP}=p$ (methoxyphenyl).

Using Josiphos-SL-J002-1, a member of the typical family of chiral ligands for intramolecular asymmetric hydroaminations, ${ }^{20 e}$ only gave traces of 2 d (Table 1, entry 1 ). When ( $R$ )BINAP was used as chiral ligand, 3-vinyl-1,4-benzodiazepine 2d could only be obtained in a low 19\% yield and 57:43 er in the presence of rac-BNP as Brønsted acid (Table 1, entries 2 and 3). The yield increased to $58 \%$, without any erosion of enantioselectivity, when the reaction was run for 5 days at the same temperature (Table 1, entry 4). Pleasingly, when chiral biaryl phosphine ligands ( $R$ )-DTBM-Segphos and ( $S$ )-DTBMGarphos were used (Table 1, entries 5 and 6), good yields and promising enantioselectivities of 2 d ( $73-81 \%, 14-34 \%$ ee) were obtained. ${ }^{24}$ We reasoned that a more rigid $N$-protecting group (e.g., tosyl group) might help to increase the enantioselectivity of the hydroamination. In fact, when $\mathbf{1 e}$ ( $\mathrm{PG}=\mathrm{Ts}$ ) was used in the presence of $(R)$-DTBM-Garphos as chiral ligand and TFA as Brønsted acid ( $\mathrm{p} K_{\mathrm{a}}=0.52$ ), the corresponding 3 -vinyl-1,4-benzodiazepine 2 e was obtained in $50 \%$ yield and 80:20 er (Table 1, entry 7). ${ }^{25}$ Unfortunately, reaction at a higher temperature, $70^{\circ} \mathrm{C}$, had limited effect in yield with quite considerable erosion of enantioselectivity (Table 1, entry 8). ${ }^{24}$

The fact that the best result regarding the enantioselectivity was $60 \%$ made us wonder about the influence of the Brønsted acid in the isomerization process of the internal alkyne to the terminal allene. So, we decided to directly synthesize allenes 3d and 3 e to make them react under the optimized conditions (Table 2). Unfortunately, when using chiral biaryl phosphine ligands ( $R$ )-DTBM-Segphos and (R)-DTBM-Garphos, allene

3d gave rise to 3 -vinyl-1,4-benzodiazepine 2 d in moderate to good yields with modest enantioselectivities (Table 2, entries 1-3). Interestingly, hydroaminations occurred more efficiently in terms of chemical yields and enantioselectivities with the more rigid tosylated allene 3 e . Under standard conditions with PPTS as Brønsted acid ( $\mathrm{p} K_{\mathrm{a}}=5.21$ ) and ( $R$ )-DTBM-Segphos as chiral ligand, the 3 -vinyl-1,4-benzodiazepine 2 e could be obtained in $80 \%$ yield and 90:10 er (Table 2, entry 4). ${ }^{26}$ To our delight, upon changing the nature of the chiral ligand to (R)-DTBM-Garphos, the 1,4-BDZ 2 e could be obtained in $70 \%$ yield with an excellent 95:5 er (Table 2, entry 5). Curiously, the employment of chloroacetic acid ( $\mathrm{p} K_{\mathrm{a}}=2.87$ ) favors the reaction to give an excellent yield ( $90 \%$ ) but with slight erosion of enantioselectivity ( $91: 9$ er, Table 2, entry 6). Conversely, when the reaction was performed at a higher temperature, $70{ }^{\circ} \mathrm{C}$, a lower chemical yield was obtained ( $60 \%$ ) but without loss of enantioselectivity ( $95: 5 \mathrm{er}$, Table 2, entry 7). ${ }^{24}$ This result contrasts with the drop of ee when using the alkyne 1e at $70{ }^{\circ} \mathrm{C}$ (Table 1, entry 8). We speculate that the nature of the Brønsted acid is crucial (PPTS vs TFA) to favor a cationic intermediate (with PPTS) that would evolve via an "outer sphere" mechanism rather than a more neutrallike intermediate (with TFA) that might favor competitive mechanisms that would erode the enantioselectivity of the process.

Having established the optimized conditions, a series of N benzylamino N -tosyl allenes $\mathbf{3}$ bearing different substituents on the benzene ring were screened (Scheme 3). ${ }^{27}$ All of the tested substrates bearing strong EDG and EWG ( $\mathrm{OMe}, \mathrm{CF}_{3}$ ), halogens ( $\mathrm{F}, \mathrm{Cl}, \mathrm{Br}$ ), or alkyl ( Me ) groups in any position of the ring are well tolerated to give the corresponding 3 -vinyl-$1,4-$ BDZs $2 \mathbf{f}-\mathbf{2 n}$ in rather good yields and excellent enantiomeric ratios, indicating that the electronic properties of the aromatic moiety have little influence on the reactivity and enantioselectivity. By contrast, the asymmetric reaction was very sensitive to the nature of the nucleophile since the

hydroxylated allene 3a smoothly cyclized to the 3 -vinyl-1,4benzoxazepine 2a ( $90 \%$ yield) but with a moderate 78:22 er.

From the literature ${ }^{28}$ and our own observations/results during the screening of the reaction conditions, we cannot anticipate which one of the two competing pathways typically proposed for Rh-catalyzed hydrofunctionalizations based on "inner" (reductive elimination) or "outer" (external nucleophile attack) is operating. ${ }^{19,20}$ The nature of the nucleophile plays a crucial role in the last $\mathrm{C}-\mathrm{X}(\mathrm{N}, \mathrm{O})$ bond formation (hydroamination vs hydroalkoxylation). Thus, when NHPMP acts as a nucleophile, an $\mathrm{S}_{\mathrm{N}} 2$ attack over the Rh- $\pi$-allyl complex may occur ("outer sphere"). ${ }^{29}$ On the other hand, alcohols typically follow a reductive elimination when they act as a nucleophile ("inner sphere"), and this may cause the low enantioselectivity found in the cyclization of benzylic alcohol 3a. ${ }^{30}$

We next turned toward derivatization of the enantioenriched 3 -vinyl-1,4-benzodiazepine obtained (Scheme 4). Orthogonal N -deprotection of the PMP group of 2 e was carried under typical oxidative cleavage conditions (CAN in a mixture of $\mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O}$ ) to give rise to the desired benzylammonium salt 4 in $85 \%$ yield. ${ }^{31}$ On the other hand, removal of the Ts group of 2 e could be achieved using mild reducing conditions ( Na , naphthalene, rt) to afford the aniline 5 in $85 \%$ yield. ${ }^{32}$ The benzylammonium salt 4 reacted smoothly with acryloyl chloride to afford amide 6 in $65 \%$ yield. Finally, an RCM (Hoveyda-Grubbs catalyst second G, $87 \%$ ) gave rise to the pyrrol-2-one ring 7, which is an advanced metabolite of Lixivaptan, a vasopressin $\mathrm{V}_{2}$-receptor antagonist to treat congestive heart failure and liver cirrhosis. ${ }^{7,33}$ The derivatization process occurred without erosion of enantioselectivity (94:6 er).

In summary, we have developed an intramolecular Rhcatalyzed hydrofunctionalization of internal alkynes and allenes to benzofused seven-membered heterocycles. The asymmetric hydroamination of (aminomethyl)aniline derivatives afforded chiral 3 -vinyl-1,4-benzodiazepines (1,4-BZDs) with good to excellent yields and enantioselectivities. Orthogonal $N$ deprotection of 1,4 -BZDs allowed an easy manipulation that

## EXPERIMENTAL SECTION

General Information. All reactions were performed under an inert atmosphere of argon and with anhydrous solvents in a glassware oven or flame-dried at $80^{\circ} \mathrm{C}$ unless otherwise stated. All chemicals were purchased from Acros Organics Ltd., Aldrich Chemical Co. Ltd., Alfa Aesar, Strem Chemicals Inc., Fluorochem Ltd., or TCI Europe N.V. chemical companies and used without further purification, unless otherwise stated. Analytical thin-layer chromatography was carried out on silica-coated aluminum plates (silica gel $60 \mathrm{~F}_{254}$ Merck) or on aluminum sheets (aluminum oxide $60 \mathrm{~F}_{254}$ neutral Merck) using UV light as a visualizing agent ( 254 nm ) and $\mathrm{KMnO}_{4}$ (solution of 1.5 g of potassium permanganate, 10 g of potassium bicarbonate and 1.25 mL of $10 \%$ sodium hydroxide in 200 mL of water) with heat as developing agents. Flash column chromatography was performed on silica gel 60 (Merck, 230-400 mesh) with the indicated eluent. All other reagents and solvents (acetonitrile, dichloromethane, dichloroethane, tetrahydrofuran, toluene, and methanol) were used dry, unless otherwise indicated.

Enantiomeric ratio (er) values were determined on an Agilent HPLC 1100 Series or on a Jasco SFC 4000 series using commercially available chiral columns.
${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, and DEPT experiments were carried out using a Varian Inova 500, Varian Inova 400 MHz or Varian Mercury 300 MHz . All NMR experiments were recorded at 298 K otherwise stated. All chemical shifts are reported in parts per million ( ppm ) and referenced to residual solvent peaks. Coupling constants $(J)$ are given in hertz ( Hz ). Multiplicities are reported as follows: $s=$ singlet; $\mathrm{d}=$ doublet; $\mathrm{t}=$ triplet; $\mathrm{q}=$ quartet, $\mathrm{m}=$ multiplet or as a combination of them. The proton signals corresponding to NH and OH groups may not appear in the ${ }^{1} \mathrm{H}$ NMR spectra due to deuterium exchange.

Reactions were followed using a GC Agilent HP-6890N with a mass spectroscopy HP-5973N using DB-35MS and HP-5MS columns for the GC and a chemical ionization font for the MS. Mass spectrometry analysis was carried out using a Micromass Autospec, a TRACE MS, or a HP-5988-A with chemical ionization and a Bruker Microtof APCI using chemical ionization spectrometers at the CACTUS Facility (Universidade de Santiago de Compostela).

X-ray crystallographic analysis was performed at the CACTUS facility of the University of Santiago de Compostela.

General Procedure for the Preparation of Alkynes 1a, 1d, and 1e. PG-Amine Protection. $\mathrm{Boc}_{2} \mathrm{O}(9.3 \mathrm{~g}, 42 \mathrm{mmol}, 1.7$ equiv), DMAP ( $0.92 \mathrm{~g}, 7.5 \mathrm{mmol}, 0.3$ equiv), and $\mathrm{Et}_{3} \mathrm{~N}(3.5 \mathrm{~mL}, 25 \mathrm{mmol}, 1$ equiv) were added at rt to a solution of ethyl 2 -aminobenzoate (4.13 $\mathrm{g}, 25 \mathrm{mmol}, 1$ equiv) in 250 mL of dry THF ( 0.1 M ), and the reaction mixture was then stirred at $60^{\circ} \mathrm{C}$ in an oil bath for 24 h . Then the reaction was quenched at rt with $\mathrm{H}_{2} \mathrm{O}$, and both layers were separated. The aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 50 \mathrm{~mL})$, and the combination of organic layers was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The compound S1a was purified by silica gel column chromatography with hexane/EtOAc (39:1) as the eluent.

The Ts-derivative S1b was synthesized according to the literature. ${ }^{34}$

N-Alkylation. ${ }^{35}$ A round-bottomed flask equipped with a stirring magnetic bar was flamed-dried under a vacuum and backfilled with argon. Then, it was charged with NaH ( 1.2 equiv), put under a vacuum, and backfilled with argon for three times. Then DMF ( 0.33 M) was added, and the mixture was cooled to $0^{\circ} \mathrm{C}$. A solution of N protected aniline S2 ( 1 equiv) in DMF ( 2 mL ) was then added slowly, and the mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 2 h . Afterward, a propargyl bromide derivative ( 1.3 equiv) was added, and the reaction was allowed to warm slowly to rt and stirred for 16 h . The reaction was quenched with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(\mathrm{aq})$ and extracted with EtOAc. The aqueous layer was extracted with EtOAc, and the combination of organic layers was washed with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(\mathrm{aq})(3 \times 100 \mathrm{~mL})$. The combination of organic layers was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. The residue was then purified by silica gel column chromatography with hexanes/EtOAc ( $8: 2$ ) as the eluent to give the desired products $\mathbf{S 2}$.

Ester Reduction. ${ }^{36}$ DIBAL-H ( 1 M in DCM, 2.2 equiv) was added dropwise to a stirred solution of the ester $\mathbf{S 2}$ ( 1 equiv) in DCM ( 0.3 M) at $-78{ }^{\circ} \mathrm{C}$. The reaction was then stirred at that temperature for 3 h. Afterward, $\mathrm{MeOH}(5 \mathrm{~mL})$ was added followed by a saturated solution of the Rochelle Salt at $-78{ }^{\circ} \mathrm{C}$. The reaction was then warmed up to rt and stirred for 1 h . The mixture was extracted with DCM ( $3 \times 30 \mathrm{~mL}$ ), and the combination of organic layers was washed with a saturated solution of $\mathrm{NaCl}(\mathrm{aq})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The residue was then purified by silica gel column chromatography with hexanes/EtOAc (9:1 to 7:3) as the eluent to afford the desired product $\mathbf{S 3 d} / \mathbf{1 a}$.
tert-Butyl But-2-yn-1-yl(2-(hydroxymethyl)phenyl)carbamate (S3d): $99 \%$ yield ( $2.53 \mathrm{~g}, 9.2 \mathrm{mmol}$ ); amorphous white solid. It was used in the next step without further purification.

Alcohol Oxidation. DMP ( 1.1 equiv) was added to a stirred solution of the alcohol S3d/1a (1 equiv) in DCM ( 0.25 M ) at rt. The mixture was stirred for 30 min . The reaction was quenched with a 1 M solution of $\mathrm{NaOH}(\mathrm{aq})$ and extracted with $\mathrm{DCM}(2 \times 30 \mathrm{~mL})$. The combination of organic layers was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The residue was used in the next step without further purification.

Reductive Amination. $p$-Anisidine ( 1.5 equiv) was added to a stirred solution of the aldehyde previously synthesized in MeOH ( 0.25 M ) or ( $1: 1 \mathrm{MeOH} / \mathrm{DCM}$ ) under an argon atmosphere. The reaction was stirred at room temperature for 18 h . Then the reaction was cooled to $0{ }^{\circ} \mathrm{C}$, and $\mathrm{NaBH}_{4}$ (1.1 equiv) was added portionwise. The reaction was then allowed to warm up to rt and stirred for 2 h . The reaction was quenched with water and extracted with DCM. The combination of organic layers was washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The residue was then purified by silica gel column chromatography with hexanes/EtOAc (9:1 to 8:2) as the eluent to give the desired products $\mathbf{1 d} / \mathbf{1 e}$.

General Procedure for the Racemic Cyclization of Alkynes 1. A 5 mL sealed tube equipped with stirring magnetic bar was flamed-dried under a vacuum, cooled to rt, and backfilled with argon. Then it was charged with $[\mathrm{Rh}(\mathrm{cod}) \mathrm{Cl}]_{2}(4 \mathrm{mg}, 8 \mu \mathrm{~mol}, 0.04$ equiv), $r a c-$ BNP acid ( $5.6 \mathrm{mg}, 16 \mu \mathrm{~mol}, 0.08$ equiv), and rac-BINAP ( $10 \mathrm{mg}, 16 \mu \mathrm{~mol}, 0.08$ equiv). Afterward, it was put in a vacuum and backfilled with argon three times. Then 0.5 mL of DCE was added, and the mixture was stirred for 10 min at rt . Finally, the alkyne $\mathbf{1}(0.2 \mathrm{mmol}, 1$ equiv) was added under a flow of argon, and the mixture was stirred at $70^{\circ} \mathrm{C}$ in an oil bath for 24 h . After cooling at rt , the solvent was evacuated in vacuo, and the residue was purified by silica gel column chromatography with EtOAc/Hexanes (1:9) as the eluent to give the desired seven-membered heterocycle 2.

General Procedure for the Asymmetric Cyclization of Alkynes 1. A 5 mL sealed tube equipped with stirring magnetic bar was flameddried under a vacuum, cooled to rt, and backfilled with argon. Then, it was charged with $[\mathrm{Rh}(\operatorname{cod}) \mathrm{Cl}]_{2}(4 \mathrm{mg}, 8 \mu \mathrm{~mol}, 0.04$ equiv), Brønsted acid ( $16 \mu \mathrm{~mol}, 0.08$ equiv), and chiral ligand ( $16 \mu \mathrm{~mol}, 0.08$ equiv). Afterward, it was put in a vacuum and backfilled with argon three times. Then, 0.5 mL of DCE was added, and the mixture was stirred for 10 min at rt . Finally, the alkyne $\mathbf{1}(0.2 \mathrm{mmol}, 1$ equiv) was added under a flow of argon, and the mixture was stirred at $50^{\circ} \mathrm{C}$ in an oil bath for 24 h . After cooling at rt and stripping off the solvent, the resulting residue was purified by silica gel column chromatography with $\mathrm{EtOAc} /$ Hexanes ( $1: 9$ ) as the eluent to give the desired sevenmembered heterocycle 2.

Homologation of Alkynes to Allenes. CuI ( 0.5 equiv), ( CHO$)_{n}$ ( 2.5 equiv), and $\mathrm{Cy}_{2} \mathrm{NH}$ ( 1.8 equiv) were added to a stirred solution of the alkyne $\mathbf{S 1 0}$ ( 1 equiv) in dioxane ( 0.2 M ). The reaction was then heated to reflux in an oil bath for 6 h . Then, the reaction was cooled to rt, and the solvent was removed in vacuo. The residue was dissolved in $\mathrm{CHCl}_{3}(50 \mathrm{~mL})$ and washed with $10 \% \mathrm{NH}_{4} \mathrm{OH}(2 \times 50$ $\mathrm{mL})$ and $\mathrm{H}_{2} \mathrm{O}(2 \times 50 \mathrm{~mL})$. The combination of organic layers was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and concentrated in vacuo. The residue was purified by silica gel column chromatography with hexanes/EtOAc (8:2) as the eluent to give the allenes S11.

Preparation of Allenes 3: General Procedure. Tosylamides S13 were synthesized according to literature. ${ }^{44}$
$N$-Alkylation. A round-bottomed flask equipped with a stirring magnetic bar was flamed-dried under a vacuum and backfilled with argon. Then, it was charged with $\mathrm{K}_{2} \mathrm{CO}_{3}$ (2 equiv), and the corresponding tosylamide $\mathbf{S} 13$ was put under a vacuum and backfilled with argon three times. Then DMF ( 0.25 M ) was added, and the mixture was stirred for 30 min at rt. Afterward, a propargyl bromide derivative ( 1.5 equiv) was added, and the reaction was warmed to 80 ${ }^{\circ} \mathrm{C}$ in an oil bath for 16 h . The reaction was quenched with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(\mathrm{aq})$ and extracted with EtOAc. The aqueous layer was extracted with EtOAc, and the combination of organic layers was washed with a saturated solution of $\mathrm{NH}_{4} \mathrm{Cl}(\mathrm{aq})(3 \times 100 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo. The residue was then purified by silica gel column chromatography with hexanes/EtOAc (7:3) as the eluent to give the propargylated products S14.

General Procedure for the Asymmetric Cyclization of Allenes 3. A 5 mL sealed tube equipped with a stirring magnetic bar was flameddried under a vacuum, cooled to rt, and backfilled with argon. Then it was charged with $[\mathrm{Rh}(\operatorname{cod}) \mathrm{Cl}]_{2}(3 \mathrm{mg}, 6 \mu \mathrm{~mol}, 0.04$ equiv), PPTS (4 $\mathrm{mg}, 15 \mu \mathrm{~mol}, 0.1$ equiv) or $\mathrm{ClCH}_{2} \mathrm{CO}_{2} \mathrm{H}(1.4 \mathrm{mg}, 15 \mu \mathrm{~mol}, 0.1$ equiv), and ( $R$ )-DTBM-Garphos ( $19 \mathrm{mg}, 15 \mu \mathrm{~mol}, 0.1$ equiv). Afterward, it was put in a vacuum and backfilled with argon for three times. Then 0.4 mL of DCE was added, and the mixture was stirred for 10 min at rt. Finally, the allene $3(0.15 \mathrm{mmol}, 1$ equiv) was added under a flow of argon, and the mixture was stirred at $50^{\circ} \mathrm{C}$ in an oil bath for 24 h . After the mixture was cooled at rt and the solvent was stripped off, the resulting residue was purified by silica gel column chromatography with hexanes/EtOAc $(9: 1)$ as the eluent to give the desired seven-membered heterocycle 2.
