Received 21 July 2011; accepted 22 July 2011

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.001\text{ \AA}$ ;  $R$  factor = 0.039;  $wR$  factor = 0.120; data-to-parameter ratio = 16.4.

One of the tertiary amine atoms has been protonated in the title salt,  $\text{C}_{36}\text{H}_{57}\text{N}_4^+\cdot\text{NO}_3^-$ . The four N atoms of the macrocycle are almost coplanar (r.m.s. deviation = 0.0053 Å), a result correlated with the formation of intramolecular N–H···N and N–H···(N,N) hydrogen bonds. With respect to this plane, the benzyl groups lie to either side; a similar arrangement pertains for the cyclohexyl rings (each with a chair conformation). Helical supramolecular chains are evident in the crystal, whereby alternating cations and anions are linked by C–H···O interactions. The chains are consolidated into supramolecular arrays in the *ab* plane via C–H···π contacts involving both benzene rings.

## 2,13-Dibenzyl-5,16-diethyl-2,6,13,17-tetraazatricyclo[16.4.0.0<sup>7,12</sup>]docosan-2-i<sup>um</sup> nitrate

J.-H. Choi, M. A. Subhan, S. W. Ng and E. R. T. Tiekink

### Comment

The title salt, (I), was isolated unexpectedly during the course of studies of partially *N*-substituted tetraazamacrocycles of interest owing to their various applications (Choi *et al.*, 2006; Choi *et al.*, 2010a; Choi, *et al.*, 2010b). As seen in Fig. 1, one of the tertiary amine-N atoms, *i.e.* N1, has been protonated with the charge balance provided by the nitrate anion. The four nitrogen atoms lie in a plane with a r.m.s. deviation = 0.0053 Å; the maximum deviation from the least-squares plane is 0.0055 (4) Å for atom N1. This observation is readily explained in terms of the intramolecular N—H···N hydrogen bonds with the N1—H1 atom being bifurcated, Table 1 and Fig. 2. With reference to this plane, the benzyl groups lie to either side and are twisted with respect to the N<sub>4</sub> plane as seen in the values of the dihedral angles of 63.62 (3) and 66.25 (3) ° formed with rings (C2—C7) and (C20—C25), respectively. Similarly, the cyclohexyl rings, each with a chair conformation, lie to either side of the N<sub>4</sub> plane.

The anion is associated with the cation *via* C—H···O contacts, Table 1, so that the nitrate-O1 forms a contact with a benzyl-methylene-H, and the nitrate-O3 atom bridges a methylene-H derived from a cyclohexyl ring and a methylene-H from the macrocyclic framework. The result is the formation of a helical supramolecular chain along the *b*-axis, Fig. 2. Chains are consolidated into layers in the *ab*-plane *via* C—H···π interactions involving benzene rings, Table 1 and Fig. 3.

### Experimental

The macrocycle, 5,16-diethyl-2,6,13,17-tetraazatricyclo[14.4.0<sup>1,18</sup>.0<sup>7,12</sup>]docosane, was prepared according to a published procedure (Lim *et al.*, 2006). To a solution of this macrocycle (0.61 g, 2.0 mmol) in methanol (10 ml) was added benzyl bromide (0.68 g, 4.0 mmol) and a solution containing sodium carbonate (0.42 g, 4.0 mmol) in water (5 ml). The mixture was refluxed for 24 h. The solution was cooled, the white solid collected and washed with water. The title di-benzyl substituted macrocyclic nitrate was the unexpected colourless by-product that was obtained when copper nitrate trihydrate (0.06 g, 0.25 mmol) and the dibenzyl-substituted macrocycle (0.16 g, 0.29 mmol) was reacted in THF (10 ml). The compound was recrystallized from acetonitrile-water (1:1) in the form of colourless prisms.

### Refinement

Carbon-bound H-atoms were placed in calculated positions [C—H 0.95 to 0.98 Å, *U*<sub>iso</sub>(H) 1.2 to 1.5*U*<sub>eq</sub>(C)] and were included in the refinement in the riding model approximation. The amino H-atoms were located in a difference Fourier map, and were refined with a distance restraint of N—H 0.88±0.01 Å; their *U*<sub>iso</sub> values were refined.

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

### Hydrogen-bond geometry ( $\text{\AA}$ , $^\circ$ )

Cg1 and Cg2 are the centroids of the C2—C7 and C20—C25 benzene rings, respectively.

$D\text{—H}\cdots A$	$D\text{—H}$	$H\cdots A$	$D\cdots A$	$D\text{—H}\cdots A$
