[1] Two validated QoL questionnaires with very large difference between outcomes
[2] Predominantly NMIBC patients, scores not specific for MIBC population
[3] Small number of patients
[4] Large difference in populations hence diverging scores
[5] Use of different QoL scales
[6] Only one study representing metastatic population, no studies representing neoadjuvant population
[7] Mixed BC population, selected population [34]
[8] Compliance 47-77%, thereby introducing selection bias
[9] QoL questionnaires designed for prostate population
[10] As estimated by funnel plot
