Abstract:

The COVID-19 pandemic has placed substantial strain on the global healthcare workforce, disrupting essential and non-essential services. Task sharing of test and treat services to non-traditional prescribers, like pharmacists, can facilitate more resilient healthcare systems by expanding access to health services while simultaneously decreasing the pressure on traditional healthcare providers. Expansion of pharmacists' scope of work has historically been hindered by socio-political, resourcing, and competency considerations; addressing these challenges will be key to including pharmacists in testing and treatment of priority diseases. Socio-political considerations include migrating to flexible national legislation and scope of practices as well as engagement with other healthcare providers and the public to increase the acceptance of pharmacists participating in test and treat services. Resourcing issues include healthcare financing for test and treat services to parallel established systems or utilize voucher systems and service competition. Also, pharmacists can utilize their training in supply chain management to ease and prevent medication stockouts in test to treat initiatives. Investments in technologies that support disease surveillance, basic reporting, and interoperability with health management information systems can integrate these initiatives into healthcare systems. Competency considerations comprise test and treat specific education for the pharmacy profession to equip them with the knowledge and confidence to execute successfully. Monitoring and evaluating the outcomes of these services can facilitate the scalability of test and treat initiatives. Pharmacists are uniquely positioned to bring testing and treatment from the clinic to the community.

48 The COVID-19 pandemic has placed considerable pressure on healthcare systems globally. An estimated
49 shortage of 18 million healthcare workers existed before the pandemic and burnout has been rampant
50 during the pandemic.^{1,2} These healthcare worker shortages could result in excess morbidity and
51 mortality of communicable and non-communicable diseases (NCDs).³ Meanwhile, declines in healthcare
52 facility visits have been common during the pandemic and still may not have fully rebounded three years
53 into the pandemic.³ Task sharing, that is, the redistribution of tasks to healthcare cadres in non-
54 traditional roles, can address these disrupted services and foster more resilient healthcare systems.⁴
55 Pharmacists have the clinical training and medication-use system expertise to help alleviate health
56 system pressures and address acute healthcare needs by providing testing and treatment services for
57 select diseases, including COVID-19.^{5,6} Pharmacists are also often the most accessible healthcare
58 provider in many countries, particularly in rural areas.^{7,8}

60 The World Health Organization recommends implementing or expanding task sharing, particularly when
61 certain services are hindered by a shortage of healthcare personnel like physicians or nurses. WHO
62 includes pharmacists as a cadre whose scope of practice could be expanded.⁴ Conditions that require
63 point-of-care testing and simple treatment regimens to prevent severe disease and transmission can be
64 well-suited for task sharing. Globally, pharmacists have seen their scope of work expand; albeit, at
65 various rates, from one of pure dispensing to providing testing and treatment for diseases such as
66 urinary tract infections.⁹ Similarly, in countries with large HIV epidemics, pharmacists now provide HIV
67 testing and subsequent pre- and post-exposure prophylaxis.¹⁰ Chronic care, like hypertension and
68 diabetes, has seen improvement in outcomes when pharmacists participate in the diagnosis, monitoring
69 of appropriate tests and subsequent drug therapy.¹¹ Other diseases for which pharmacists trained in
70 disease-based protocols could manage include mild cases of malaria, sexually transmitted diseases,
71 leishmaniasis, influenza, and COVID-19 requiring oral therapies (or topical therapy in the context of
72 leishmaniasis).

74 Despite evidence that the scope of work of pharmacists can be successfully expanded, proposals for
75 expansion are often stymied by systemic and regulatory barriers. Efforts to expand the scope of practice
76 of pharmacists have been met with socio-political, resourcing, and competency challenges.¹² The United
77 States, for example, has struggled with the idea of giving pharmacists the right to treat COVID-19 with
78 oral antivirals despite pharmacists testing for it, with national physician organization's hesitancy and lack
79 of reimbursement impacting the decision.¹³ Addressing these considerations will be critical for task
80 sharing of test and treat initiatives with pharmacists.

82 **Socio-political context**

84 Engagement with government officials, healthcare professionals, and professional associations to
85 transition to a regulatory system that provides flexibility, decentralization, overlapping, and non-
86 exclusiveness for pharmacists' scope of practice is critical for task sharing. Existing pharmacy practice
87 legislation may limit engagement of pharmacists in test and treat programs namely through restrictions
88 on prescribing rights and billing for pharmacy clinical services.¹⁴⁻¹⁶ Centralized pharmacy legislation can
89 be rigid and unable to be adapted to specific local needs; successful decentralized models such as
90 boards of pharmacy or pharmacy-determined may provide a more efficient route to enacting test and
91 treat services.¹⁷ For example, several states in the United States have proceeded with a decentralized
92 approach to allow pharmacists to prescribe hormonal contraceptives.¹⁸

94 Legislation and national guidelines that are broad can allow pharmacists to test for and treat emerging
95 diseases immediately. Temporary waivers and expanded scope of practice during public health

96 emergencies such as the COVID-19 pandemic can empower pharmacists to provide test and treat
97 services. In Europe, several countries relaxed regulation on controlled substances, and increased
98 pharmacist prescribing authority and medication substitution rights during the COVID-19 pandemic.¹⁹
99

100 Medications or diagnostic tests that are approved by regulatory agencies for emergency use could
101 include pharmacists in authorization to prevent legal hurdles. In the United States, for example, the
102 COVID-19 Public Readiness and Emergency Preparedness (PREP) Act allowed pharmacists to test and
103 treat COVID-19 at the same time as restrictions on oral antiviral's initial emergency use authorization
104 excluded pharmacists as viable prescribers for these agents.²⁰ More inclusive regulatory policies can
105 facilitate collaboration between healthcare professionals and can enhance participation of pharmacists
106 in task sharing initiatives.

107
108 Traditional healthcare prescribers' acceptance and confidence in shifting testing and treatment services
109 to pharmacist can impact the rollout of such efforts. Providing clarity for the role of pharmacists in a
110 certain healthcare program and how they can benefit other healthcare workers can help garner buy-
111 in.^{21,22} Positive interprofessional relationships and ease of disease management are two factors to
112 consider in execution.^{22,23} Strong partnerships with pharmacists may encourage other health care
113 providers to consider the benefit of referring patients with priority diseases to pharmacists for testing
114 and treatment. Community attitudes towards expanding pharmacy services in country-specific contexts
115 will also need to be explored to encourage use of testing and treatment from pharmacists. In countries
116 where pharmacists only dispense medications, starting task sharing with initiatives such as providing
117 medication refills for chronic diseases after appropriate biomarker monitoring by pharmacists and
118 treatment of minor ailments may facilitate the transition to more involved diagnosis and treatment
119 initiation.²⁴
120

121 Global, national, and local pharmacy associations can play a critical role advocating for test and treat
122 services. These professional bodies may influence aspects of task sharing through partnerships with
123 regulatory agencies, pharmacy education accreditation councils, and other healthcare professional
124 organizations. Pharmacy organizations can conduct needs assessments and outline priorities for test and
125 treat initiatives. The Commonwealth Pharmacists Association organized virtual interviews with national
126 pharmacy associations to frame themes and subthemes of priorities, including the expansion of
127 pharmacy roles, to achieve sustainable development goals and universal health coverage.²⁵
128

129 Pharmacy associations can also leverage data or support the development of data systems for the
130 inclusion or effective use of pharmacists. The American Pharmacists Association (APhA) examined
131 federal test and treat locations in socially vulnerable communities and found a dearth of pharmacists in
132 these neighborhoods that were being underutilized and could be used to fill Paxlovid access gaps. APhA
133 communicated this data to the Food and Drug Administration which played a role in the approval of
134 pharmacists to prescribe Paxlovid in July, 2022.^{26,27} Pharmacists in Québec, Canada were authorized to
135 prescribe Paxlovid in May 2022. In Canada, the Pharmacists' Association of Newfoundland and Labrador
136 have long advocated for expansion of pharmacists, giving them a large degree of autonomy to prescribe
137 and allowing a quick adjustment to prescribe upon introduction of new agents during a pandemic.²⁸
138 International pharmacy bodies, like the International Pharmaceutical Federation, can share best
139 regulatory practices between countries with established test to treat services and those in their
140 infancy.²⁹
141

142 **Resourcing Allocation**

143

144 Pharmacists providing test and treat services will need to be compensated for the services they provide.
145 To realize the potential of task sharing to pharmacists, funding mechanisms must cover the broad
146 network of pharmacies embedded in local communities. Test and treat payments to pharmacists could
147 be covered in a manner consistent with how care is already funded. Broadly, healthcare is funded
148 through four different mechanisms, with each major mechanism having its own defining features. First,
149 many people gain access to healthcare services through government sponsored universal health
150 coverage (UHC). In countries that offer UHC, government pays healthcare providers, directly or
151 indirectly, to serve the population. This type of funding is considered public health insurance. In addition
152 to, or in place of, public insurance, private health insurance is another mechanism. In countries that
153 depend in little or part on private health insurance, individuals or employers purchase insurance
154 through premiums to help pay for future care. In many countries, patients pay for all or select health
155 services at the point of care. These are often referred to as out-of-pocket payments or user fees. Finally,
156 in some countries, nongovernmental organizations (NGOs) or faith-based organizations provide
157 resources to run or supplement healthcare facilities. These funding mechanisms may co-exist in a
158 country.

159
160 Given these funding mechanisms, test and treat payments to pharmacists could parallel or be integrated
161 into current health payment systems. Governments could rollout test and treat services in public
162 pharmacies to expedite service expansion while developing mechanisms for government-subsidized
163 service provision in private pharmacies. In countries with public or private health insurance, payors
164 could extend payments to community-based private pharmacies in the same way that it pays for
165 covered medications dispensed locally, for example, by submitting a claim with identifiable patient
166 information while billing for their clinical services. The rapid increase in the number of urgent care and
167 community clinics in the United States highlights the potential for profits in this arena as well as unmet
168 healthcare needs.³⁰ New Zealand transitioned COVID-19 oral antivirals to advance prescriptions, allowed
169 pharmacists to prescribe them, and then ensured funding for these pharmacy services from previously
170 agreed upon national COVID-19 healthcare provider service's rates.³¹ In countries where pharmacy
171 services are primarily funded by out-of-pocket payments two approaches may exist. In the first,
172 pharmacists who procure their own commodities may charge for testing and treatment services. In this
173 scenario, an additional benefit of expanding pharmacy services is that patients may pay lower fees due
174 to the increased competition and potentially lower cost for offering services in this setting of care. In the
175 second, private pharmacists who receive subsidized testing and treatment commodities from the
176 government or donors could in turn provide these services for free or at a subsidized rate. Fraud and
177 overcharging could be prevented by requiring pharmacists to submit proof of services provided and
178 results to the appropriate agency to be reimbursed. Alternatively, governments and NGOs could
179 implement a voucher-like system, in which 1) community health workers or an NGO distribute vouchers
180 to patients, 2) patients surrender vouchers to pharmacists providing test and treat services as specified
181 by the voucher, and 3) pharmacists submit vouchers for payment after services are rendered.³² Voucher
182 distribution could be targeted or broad depending on the disease.

183
184 While not unique to the pharmacy profession, gaps in the pharmaceutical global supply chain can limit
185 the effectiveness of test and treat programs. Pharmacists may not have access to the appropriate
186 antimicrobial agent or a chronic NCD therapeutic modality. The COVID-19 pandemic has exacerbated
187 medication stock-outs stemming from large distribution hubs being locked down or a shortage of
188 workers.³³ Healthcare systems can protect themselves from supply chain disruptions through dual
189 sourcing, diversifying importation location, promoting supply chain transparency, investing in local
190 supply companies, and digitalizing supply chain management.³³ If supply chain disruptions are not
191 adequately addressed, the distribution and use of counterfeit and substandard medications (CSM) could

192 increase, imperiling patient health and weakening the global supply chain further. In a review of drug
193 products from low- and middle-income countries, WHO found that more than one-third of the
194 hypertension, cancer, epilepsy, and analgesic medications were either falsified or substandard.³⁴ CSM
195 have led to increased mortality from absence of active ingredients or harmful substances present in the
196 final product.^{35,36} Additionally, theft and resale of approved medications threaten the supply chain's
197 integrity.³⁷ Internet pharmacies that operate outside of the traditional supply chain can also introduce
198 CSMs. Pharmacists, often the leads of supply chain management in health facilities globally, have been
199 identified as competent professionals within the medication supply chain and recognized as experts in
200 safe and legitimate medication procurement, handling, storage, and administration.³⁸ Pharmacists can
201 serve as stewards of high-standard medications and diagnostic test procurement in test and treat
202 initiatives through their connections with the pharmaceutical industry, educating patients and other
203 healthcare providers about the black market, examining and reporting suspicious medications to the
204 authorities, and monitoring counterfeit product alerts.³⁹

205
206 Investments in technologies that support disease surveillance, basic reporting, and interoperability with
207 health management information systems can support the expansion of test and treat services to
208 pharmacists. Certain diseases and conditions are of public health concern and may be required to be
209 reported to health authorities; reporting could also highlight diseases that are increasing which may
210 need expanded pharmacy support. Pharmacists who provide test and treatment services can be trained
211 to report their work into national reporting systems, providing critical data to inform public health
212 monitoring. Modernizing institutional infrastructure like health management information systems can
213 facilitate pharmacist inclusion. Dispensing systems in pharmacies often cannot provide reports about
214 medications given, therapeutic updates or even adherence rates back to other providers or to national
215 reporting systems. For patients with chronic conditions, a seamless stream of communication through
216 platforms like electronic health records or mobile paper health passports can improve continuity of care
217 and promote collaboration with other healthcare professionals.¹⁴ Having access to medical records can
218 also improve pharmacists' confidence in participating in test and treat initiatives by obtaining relevant
219 past medical history and current drug therapy.⁴⁰

220

221 **Pharmacist competence**

222

223 Assuring high competence among the pharmacy profession to participate in test and treat initiatives is
224 key to implement task sharing. Preparation of pharmacists include building on practicing pharmacists'
225 skillsets and embedding training for diagnostic tests and treatment algorithms for relevant diseases into
226 pharmacy degree curricula. Governments and health sector partners can build upon licensed
227 pharmacist's foundational knowledge of pharmaceuticals through targeted continuing education
228 programs. These programs can be administered virtually or in-person with didactic and case-based
229 learning and can be modeled off of established content like the American Pharmacist Association's
230 Pharmacy-Based Test And Treat Training Program or the UK's Centre for Pharmacy Postgraduate
231 Education's disease-specific test and treat modules.^{41,42} The International Pharmaceutical Federation
232 (FIP) and the pharmacist code of ethics in the United States and other countries express the shared
233 professional obligation that pharmacists have to maintain competency through life-long learning.^{29,43,44}
234 This commitment to life-long learning allows pharmacists to function as effective resources for the
235 communities that they serve and supports the capacity for pharmacists to be effective in test and treat
236 initiatives. .

237

238 Accreditation bodies could also establish standards to ensure the competency of outgoing pharmacy
239 students.⁴⁵ Pharmacy school curriculums could entrench test and treat principles for various diseases.

240 The expansion of the testing component through experiential, hands-on learning may improve
241 pharmacist's knowledge and confidence in using assays of different types to diagnose patients,
242 complementing their medication-use knowledge. Outlined modules, topics, and standards that have
243 been proposed in the United States or implemented in Australia and New Zealand can serve as
244 templates for pharmacy accreditation bodies globally.^{46,47} Didactic learning topics could include good
245 laboratory practices, clinical laboratory improvement amendments, business planning, quality control,
246 disease surveillance, supply chain management, and public health disease reporting.⁴⁵ The National
247 Alliance of State Pharmacy Associations has created a Pharmacy-based Point-of-Care Test & Treat
248 Program which includes many of the aforementioned topics and may be used as a platform to design
249 curricula around.⁴⁸ Pharmacy rotations can provide venues to incorporate both the hands-on diagnostic
250 training and didactic knowledge to improve competence and prepare students to enter test and treat
251 programs directly after graduation. They can further build pharmacist confidence.

252 **Conclusion**

253
254
255 As healthcare systems continue to recover from the COVID-19 pandemic, task sharing to increase the
256 scope of pharmacists to include testing and treatment for communicable and NCDs can enhance access
257 to health services and foster a more resilient health system. The socio-political context, key resources,
258 and pharmacists' competence, if adequately addressed, can facilitate an expanding role of the pharmacy
259 profession. Participating pharmacists would be given more opportunities to utilize their pharmaceutical
260 training, be adequately compensated, and expand their contribution to improve population-level health.
261 Scaling task sharing initiatives for pharmacists starting with in-house tests like lateral flow assays and
262 expanding to more complex diagnostics like send-out tests may improve acceptance from other
263 healthcare professionals and the public. Pilot test and treat services can be modeled after successful
264 programs such as the Diabetes Ten City Challenge by utilizing community-based pharmacist coaching,
265 evidenced-based guidelines, and patient self-management strategies.⁴⁹ Monitoring the reach of test and
266 treat strategies and the public health outcomes can provide critical evidence to support additional
267 expansion of pharmacists' scope of practice. COVID-19 has opened new avenues for task sharing;
268 pharmacists are uniquely positioned to bring testing and treatment from the clinic to the community.
